SPECIAL DELIVERY

for strategic air power!

Convair's globe-roaming B-36 is also an airport in the sky

Something new has been added to the B-36 bomber, already the most effective and versatile aerial weapon in history. Fighter aircraft such as Republic's sweptwing photo-reconnaissance version of the Thunderstreak, can be launched and retrieved by a B-36 "mother ship" in flight anywhere in the world. No extension of the U.S. Air Force strategic air arm could be more economical or timely. Engineering to the Nth power

100 Complicated Math Problems-Per-Minute Are Solved For Him AUTOMATICALLY!

As jet-powered planes streak to new altitudes and speeds, they undergo split-second changes in temperature, pressure and moisture conditions. These changes create a flood of instantly complex fuel metering problems. Adding to the complexity are the pilot's changing demands from his engine.

Solving these fuel metering problems is equivalent to solving one hundred computations every 60 seconds! The Holley Turbine Control was developed to do the job.

Manufacturing the Holley Turbine Control required highly specialized skills, too. Working to extreme tolerances, Holley's manufacturing division has produced precision turbine controls for thousands of the nation's jet engines.

PNEUMATICS IS NEWS!

The news about pneumatics is that it is on the way to becoming the actuating power of the future. Gas charges, emergency power actuating systems and other utility power applications developed by Kidde have already proved the vast potentialities of pneumatics in the field of control.

Aviation engineers are finding more and more uses for pneumatic power... a sign that the all-pneumatic aircraft may be just over the horizon.

Yet, for all the noise it's making in aviation, pneumatics certainly isn't new. More than 200 years ago, Denis Papin compressed air by power from a water wheel. And in 1849, Baron Von Reichen proposed to compress air in stages with a series of intercoolers to get 750 pounds pressure for use in locomotives. Today, a Kidde compressor the size of a table radio will deliver 3000 PSI! Think what this means where weight is a factor...

Pneumatic systems for aircraft are light, simple and safe. The use of air means an unlimited supply for the system, and eliminates the fire hazard. Pneumatic systems operate over a wide temperature range with exceptionally high energy delivery... can move huge loads quickly and easily.

We here at Kidde see a great future for pneumatics in aviation, and have been fortunate in being among the first to explore the applications of this exciting force. Perhaps you, too, are seeking new ways to apply this well-known energy source. If you have a problem in pneumatics, write us.

REX-FLEX flies with the new DC-7

Photo courtesy,
Douglas Aircraft Company,
Santa Monica, California

Anti-icing and cabin heater ducting of Douglas' newest transport protected with REX-FLEX connectors.

In the new Douglas DC-7—as in virtually every aircraft built in this country—Flexonics stainless steel assemblies play a part in vibration control. Flexible connectors for the cabin heating and anti-icing system are REX-FLEX compound stainless steel assemblies. These units are designed to isolate vibration and noise in rigid ducting and prevent its transfer to the air frame. Like all Flexonics products, these units are scientifically engineered to do their job right . . . proved in the extensive Flexonics lab before going into production . . . carefully fabricated under rigid quality control.

Experience and facilities second to none are your best assurance of getting exactly what you want when you specify Flexonics stainless steel ducting, hose, bellows and flexible connections. For recommendations, send us outline of your requirements.

EXPERIENCE, ABILITY and "KNOW-HOW"

HYDRAULIC SERVOS FOR GUIDANCE SYSTEMS

The analysis of high performance hydraulic servos for guidance systems is very new. We feel, however, that we are "old hands" in supplying the building experience and engineering "know-how".

Years of manufacturing high precision gages and measuring instruments made us a natural choice to complete large quantity manufacture for military and commercial controls. To date, thousands of component assemblies: actuators, proportional transfer valves and torque motors . . . have been built by us to meet both the dimensional and functional needs of our customers.

Our experienced engineers are available to assist you in the development of hydraulic servo systems for every application. And we have the facilities: design, inspection and testing facilities to maintain a high degree of quality and dimensional control in meeting prototype or production schedules.

We can help make the dreams of your designers and development engineers come true. Call us and turn your problem involving servo-mechanisms.

FIRST

**FOR MAXIMUM
CIRCUIT SAFETY**

YESTERDAY — Many of the most important technical improvements in aircraft electrical harness systems were originated by Burndy engineers working closely with the aircraft industry.

TODAY — Burndy terminals, joints, installers and disconnect panels are specified for use in nearly every modern aircraft, military and commercial.

TOMORROW — Products now under development at Burndy will help make future planes still faster, lighter, safer.

(Write Aircraft Products Division for specific bulletin)

Eastern adds a New Constellation to the Skies!

... Once again Sinclair
is chosen for dependable
engine lubrication...this time,
for the Super-C.

The newest member of Eastern's Great Silver Fleet has taken to the skies. The latest in Constellations, Eastern Air Lines' SUPER-C is designed to give Eastern passengers faster service with the same dependability proven over billions of passenger miles.

As with every airline, Eastern stresses reliable performance—brought about by dependable products. Proof of the aviation industry's confidence in Sinclair may be found in the fact that 43% of the aircraft oils used by major scheduled airlines in the U. S. is supplied by Sinclair. Why not place your confidence in Sinclair Aircraft Oil?

FLY SAFELY

[These weather items prepared in consultation
with the United States Weather Bureau]

ALLOW EXTRA MARGIN of air speed when heading into vicinity of thunderstorms because of sudden wind shifts and gusts. Rapid shifts when approaching the cold downdraft put ahead of the nose.

REMEMBER—Anemometer is open heading wind direction in degrees magnetic, like runway. On weather reports, however, wind direction is always with reference to true north. Over 20° difference in some parts of U. S.

WINDS ALOFT usually differ greatly from surface winds. Check the U. S. Weather Bureau's Winds Aloft Analysis, round 4 miles dial and disambiguate an aviation teleprinter circuit.

AS SHOWN ON MAP, winds blow nearly parallel to isobars—the closer the isobars, the stronger the winds. When isobars the wind, high pressure lies to left and low pressure to right. (Weather Bureau)

FAST-SHIFTING winds call for quick engine response at a moment's notice. That's why we pilot protect power and performance with the very best fuels and lubricants—Mobilgas Aircraft and Mobiloil Aero.

These famous Flying Red Horse products meet aviation's toughest tests... exceed rigid Army and Navy specifications... have the approval of every major aircraft builder.

Fly safely! Fly with the Flying Red Horse!

0-18570-18580-18590-18600-18610-18620-18630-18640-18650-18660-18670-18680-18690-18700-18710-18720-18730-18740-18750-18760-18770-18780-18790-18800-18810-18820-18830-18840-18850-18860-18870-18880-18890-18900-18910-18920-18930-18940-18950-18960-18970-18980-18990-19000-19010-19020-19030-19040-19050-19060-19070-19080-19090-19100-19110-19120-19130-19140-19150-19160-19170-19180-19190-19200-19210-19220-19230-19240-19250-19260-19270-19280-19290-19300-19310-19320-19330-19340-19350-19360-19370-19380-19390-19400-19410-19420-19430-19440-19450-19460-19470-19480-19490-19500-19510-19520-19530-19540-19550-19560-19570-19580-19590-19600-19610-19620-19630-19640-19650-19660-19670-19680-19690-19700-19710-19720-19730-19740-19750-19760-19770-19780-19790-19800-19810-19820-19830-19840-19850-19860-19870-19880-19890-19900-19910-19920-19930-19940-19950-19960-19970-19980-19990-20000-20010-20020-20030-20040-20050-20060-20070-20080-20090-20100-20110-20120-20130-20140-20150-20160-20170-20180-20190-20200-20210-20220-20230-20240-20250-20260-20270-20280-20290-20300-20310-20320-20330-20340-20350-20360-20370-20380-20390-20400-20410-20420-20430-20440-20450-20460-20470-20480-20490-20500-20510-20520-20530-20540-20550-20560-20570-20580-20590-20600-20610-20620-20630-20640-20650-20660-20670-20680-20690-20700-20710-20720-20730-20740-20750-20760-20770-20780-20790-20800-20810-20820-20830-2084

SAFER SHIPS TO FLY—BECAUSE OF

AMP terminals give the extra margin, the extra factor of insurance that makes ships wired with AMP terminals safer ships to fly. That's why 85-90% of all aircraft manufacturers specify AMP terminals!

it's the extra margin
of safety
that counts!

SAFER BECAUSE:

- Rounded Insulation:**  Here it insulates that ship, not because it's **ROUNDED**—does an job on crimping action alone to maintain protection. **Insulation Resistor:**  **AMP PRE-INSULATED DIAMOND GRIP TERMINALS** have double support action over the critical junction area of wire and terminal barrel. Both inner copper sheath and tapered insulation sleeve help prevent sharp wire bends and frayed insulation.
- Controlled Insulation Tooling:**  **AMP CREEP-CRIMP HAND TOOLS** are designed to make every terminal application never too tight and always tight enough. This crimping, pre-determined crimp is the secret of AMP's outstanding performance. Few dies (up to 2-300) close with maximum every time, and the same control and precision is obtainable whenever you use AMP hand tools or AMP automatic machines! **Dot and Color Coding:**  **AMP PRE-INSULATED DIAMOND GRIP TERMINALS AND TOOLS** are color matched to insure proper combination. **AMP dot coding "brands"** each application so you know that the right team has been used together. **Speed of Application:** 
- AMP AUTOMATIC WIRE TERMINATORS** will help keep your wire preparation up to schedule. 1800 to 1800 PRE-INSULATED type terminations per hour are not unusual with these machines!

Tomorrow's Planning Today

WHEN YOU LET WEBER

Airengineering

WORK FOR YOU!

Whether you require today's known needs or are anticipating tomorrow's requirements, our planning and development engineers are ready to serve you.

From design to delivery is Weber's way of completely handling your air-frame equipment project... and you save in time and money, too, for we assume complete responsibility for research, design and modern production methods.

Why not take advantage of Weber's "Design-to-Delivery" service? Let us help you on your air-frame equipment problems. Call or write today.

New, tougher marking material passes supersonic adhesion test with flying colors!

In use on the latest and fastest supersonic fighters and test planes!

"SCOTCHCAL" Film No. 650 — an extremely tough marking material — makes both time and money on marking jobs, gives longer lasting, more attractive markings for any plane — private, commercial, or military. Exclusive adhesive fastens lets you apply numbers and markings in minutes instead of hours. And the firm-bonding adhesive doesn't let go — keeps markings of "SCOTCHCAL" Film fresh and intact for many times the life of ordinary decals... even in severe weather... even at supersonic speeds!

EASY TO APPLY. Simply strip off adhesive protector; activate and apply. No drying time. Colors are true, brilliant, eye-catching. Fractional letters, numbers, and standard borders and designs available. This is time-saving, labor-saving, cost-saving marking!

SPECIAL HEAVY DUTY MATERIAL (NO. 650)... won't rub off... won't crack when applied to locking edges, wrinkles or speed-burst skins of supersonics on 37.

VHF for air-ground communications?

dependable . . . flexible . . . versatile . . .

COLLINS 242F-3 GROUND STATION TRANSMITTER

for complete VHF Coverage . . . local or remote

106 to 152 mc. Rated at 50 watts RF output into 50 ohms. Normally supplied with power supply/modulator unit and one RF unit. Extra RF units (for simultaneous operation) can be added as required to a common power supply/modulator. Each RF unit has provision for two crystals and is equipped with a selector switch allowing a pair of channel frequencies up to

20 MC separation without retuning. Up to four RF units (eight channel frequencies) can be independently operated by the Type 275-3 Remote Control Unit. An unlimited number of RF units can be locally controlled. All units designed for 15° arc mounting. Power requirements: 115/230 volts, 50/60 cps, single phase. 800 watt transmitter, 100 watts standby.

RF UNIT — Tubes, transformers, and controls are assembled from the front. Under-chassis wiring is accessible from the rear for the removal of the protective cover. Vertical type chassis construction is employed with the tubes and components mounted horizontally. There is a sub-chassis for the oscillators, frequency modulator and driver, and a subassembly for the final amplifier. Two types of connecting plates allow aerial heat dissipation from pinning, cooler mounting equipment for longer service life.

POWER SUPPLY/MODULATOR — As in the RF unit, tubes and controls are accessible from the front. Under-chassis wiring is accessible from the rear after removal of the protective cover. Vertical type chassis construction is employed with tubes and transformers mounted horizontally.

SIM-7 VHF RECEIVER — COMPANION to 242F Transmitters

Frequency Range: 118.0 to 152.0 mc.
Sensitivity: Signal to noise ratio for a 5 microvolt input signal modulated 30% is less than 10 db.
Selectivity: Bandwidth at 6 db attenuation is less than 45 kc. Bandwidth at 30 db attenuation is not more than 100 kc.
Automatic Volume Control: Audio output will not vary more than 5 db when the input signal is varied from 5 to 100,000 microvolts.
Input Control: Input impedance 50 ohms unbalanced.
Output Control: Impedance 50 ohms high impedance winding with 4 ohm tap for antenna use and modulation.
Output Level: Not less than 2.0 watts for 5 microvolts input signal modulated 30% at 2000 cps.
Audio Frequency Response: Audio output from 300 to 2500

cps does not vary more than 3 db from audio output at 1000 cps.
Audio Distortion: Distortion is less than 10% when measured at 2.0 watts output with signal modulated 30% at 1000 cps.
Spurious Rejection: All spurious responses are attenuated at least 30 db with respect to desired signal.
Amplifier Temperature Range: -40°C to +140°C.
Ambient Humidity Range: 0 to 95% relative humidity.
Altitude: Sea level to 15,000 feet.
Frequency Stability: 0.005% over the specified service conditions.
Power Source: 115 v or 230 v 50-60 single phase a.c.
Dimensions: Width 17", height 15", depth 15".
Weight: Approx 35 lbs.
When signals specified are signal voltages in series with 50 ohms, measured with input 50 ohms.

COLLINS... OF COURSE!

When your problem is the selection of ground station VHF equipment . . . consider Collins quality, versatility and dependability

FOR EXTRA POWER 200 WATT 242F-2 Transmitter

Ambient Temperature Range: -40°C to +40°C.
Ambient Humidity Range: 0 to 95% relative humidity.
Altitude: Sea level up to 15,000 ft.
Power Source: The unit operates from 115/115/230 v at 50/60 cycles, single phase with a standby power in excess of 250 watts and a standby power requirement of 100 watts. It operates with a power factor of 90% lagging. The unit can be operated from 115 v ac with two primary windings on transformer connected in parallel or on 230 v ac with three windings in series. Low voltage units are also provided on all transmitters.
Frequency Range: 118 to 152 megacycles.
Channels: Single channel transmitter with desired output frequency determined by crystal frequency division. A spread frequency can be installed without retuning with the assumption that the channel separation shall not be more than 0.5% of operating frequency. This system will reduce power to greater than 95 db.
Frequency Stability: 0.005%.
Regulation and Output Protection: All spurious emissions, including harmonics, are at least 60 db below carrier level when used with the SIM-7 Receiver supplied with transmitter.
Audio Output: 100 ohm resistor modulator with audio-tape output or a high impedance detector microphone with push-to-talk or push-to-transmit microphone is recommended for better of superior frequency response.
Modulation: At least 30% modulation is obtained from 300 to 2500 cps or 300 to 25,000 cps depending on application.
Audio Frequency Response: Flat to ± 3 db with respect to 1000 cps over a range of 300 to 2500 cps. This is measured for 10% modulation without clipping.
Power Output: At least 200 watts is delivered into frequency load and service conditions when operating into a 50 ohm antenna load.
Carrier Shift: Receiver output decreases less than 30% over the range of 0 to 95% modulation.
Output Impedance: 50 ohms.
Noise Level: Better than 40 db below 90% modulation without clipping.
RF Output: 200 watts, 120° high and 12° deep.
Modulator Drive: 15° wide, 12° high and 12° deep.
RF Selector Drive: 14° wide, 12° high and 12° deep.
Pilot and Bias Drive: 14° wide, 10° high and 12° deep.

50 WATT 242F-3 VHF Ground-Station Transmitter

Ambient Temperature Range: -40°C to +40°C.
Ambient Humidity Range: 0 to 95% relative humidity.
Altitude: Sea level up to 15,000 ft.
Power Source: The unit operates from 115/115/230 v at 50/60 cycles, single phase with a standby power of 100 watts and a full load (modulated) power requirement of 200 watts. It operates at a power factor of 90% lagging. The unit can be operated from 115 v ac with two primary windings on the transformer connected in parallel or on 230 v ac with three windings in series.
Frequency Range: 118 to 152 megacycles.
Channels: This is a single channel transmitter with desired output frequency determined by crystal frequency division. A spread channel is provided with the assumption that the channel separation shall not be more than 0.5% of operating frequency, without retuning.
Frequency Stability: The crystals utilized are assumed to be a temperature stabilized unit to the frequency stability of $\pm 0.001\%$, as obtained under any normal combination of the service conditions.
Regulation and Output Protection: All spurious emissions, including harmonics, are at least 60 db below carrier level when used with the SIM-7 Receiver supplied with transmitter.
Modulation: High level amplitude modulation is obtained through use of a phase and cosine modulation modulator. 100% modulation is obtained from 300 to 2500 cps, or 3000 cps depending on application.
Power Output: At least 50 watts is delivered into frequency load and service conditions when operating into a 50 ohm antenna load.
Carrier Shift: Less than 10%.
Output Impedance: 50 ohms.
Audio Output: A microphone input circuit is designed to operate from a microphone input at a dynamic high impedance impedance. A 50 ohm balanced audio line is also provided for remote operation.
Audio Frequency Response: The audio frequency response of the unit is flat to ± 3 db with respect to 1000 cps over a range of 300 to 2500 cps.
Audio Frequency Distortion: The audio frequency distortion is less than 10% with a modulation level of 90%.
Noise Level: Better than -40 db.

High Temperature BOLTS

It takes a tough, heat-resistant bolt to withstand the temperatures of modern jet engines. Today, The H. M. Harper Company manufactures bolts, nuts, and other fastenings of the modern high temperature alloys such as Inconel, Refractory, A-286, and special grades of stainless steel. If you require fastenings designed to withstand high temperatures, corrosion, excessive wear, or other extreme conditions, Harper engineers and metallurgists will gladly assist you.

For over a quarter of a century, The H. M. Harper Company has specialized in the manufacture of corrosion-resistant fastenings in brass, naval brasses, silicon bronzes, nickel, aluminum, and all stainless steels, and is today America's largest producer of such fastenings.

Behind the PLEXIGLAS...

Behind every transparent endurance of PLEXIGLAS—cargoes on jet fighters and bombers; noses on helicopters; windows of transports, submarines and gun turrets—is a background of care and experience.

In Rohm & Haas Company plants, meeting physical tests harder than the pressures for which PLEXIGLAS is acrylic plastic is so varied—clarity, lamination, strength, resistance to weather—care maintained during large scale production.

Equally important is the processing care and know-how of companies in whose plants PLEXIGLAS sheets are formed and fabricated into mechanisms that are clear, strong, sound, and worthy of the trust of aircraft pilots and passengers.

Back of Rohm & Haas Company's manufacturing skill lie years of experience as the supplier of aviation's standard transparent plastic; years marked by the continuing development of improved grades of PLEXIGLAS to meet the requirements of faster, higher-flying planes.

Plexiglas is a trademark, Reg. U.S. Pat. Off. and other principal marks in the Rohm & Haas Company.

A NEW HORIZON IN SERVICE TO YOU

DANBURY, CONN.

STRATFORD, CONN.

INGLEWOOD, CALIF.

To keep pace with the growing need for completely reliable aircraft instrumentation and control components, the Aircraft Products Division of Manning, Maxwell & Moore, Inc. is now manufacturing in three strategic locations: Stratford and Danbury, Connecticut and Inglewood, California.

The expansion and dispersal of our facilities greatly augments the availability of our design, engineering, testing and production facilities. Whether your responsibilities concern the application of aircraft pressure switches, electronic amplifiers, hydraulic valves or turbojet engine control systems, we can now serve you better than ever

before. Whatever the dimensional and functional requirements of each vital component, our unique design technique eliminates all compromise with performance. For we recognize that compatibility between airframe and equipment is the key to the success of the weapons system of the U. S. Air Force, as well as the continued leadership of the nation's air transportation industry.

We believe the counsel of our engineering specialists can contribute appreciably to the safety and dependability of today's most advanced aircraft and those you are now developing. Your inquiry is invited.

ARCSIL FIBERGLASS DUCTING OFFERS NEW DESIGN APPLICATIONS

New techniques developed by Arrowhead in fabricating complex ducts, sleeves and couplings from Arcofil flexible fibreglass rubber impregnated fiberglass have opened amazing new design possibilities. In addition to Arcofil's ability to withstand heat, vibration and torque-motion-fatigue, the materials permit the parts to be formed to almost any conceivable shape and size to meet individual specifications. A variety of standard constructions offers serviceability under extreme high and low temperatures and at various pressures.

Close tolerance tooling and production costs are cut to a fraction, as compared with metal, to effect amazing savings in either experimental or production quantities. Up to 50% weight reduction is possible. Flexibility permits cranking without damage and simplifies installation.

Arrowhead specializes in solving difficult flex-connector problems in fuel, oil and air systems. Arrowhead field engineers will gladly provide further information and assistance.

WHY Aeroquip

FIRST IN PRODUCT DEVELOPMENT — You can meet your fast-changing aircraft plumbing requirements easily and quickly by calling on Aeroquip's outstanding research and engineering facilities. Aeroquip's top notch engineering team starts with your basic problem . . . then designs, tests and produces the products that provide the solution.

FIRST IN QUALITY — Aeroquip maintains uniformly high quality standards with an exacting system of quality control. Component materials, workmanship and finished products are constantly checked with precisely accurate inspection equipment . . . your assurance that Aeroquip products will perform with maximum efficiency.

FIRST IN SERVICE — The Aeroquip plant in Jackson, Michigan, and the Aero-Coupling plant in Burbank, California, offer two dependable sources for Aeroquip products and service. Both are strategically located to serve aircraft industrial centers quickly, conveniently, and completely.

Industry Will Maintain Peak...

This will be another good year for aviation. Sales volume for manufacturers of airplanes, engines, parts and accessories will climb about 10% over the postwar record \$9-billion sales total for 1953. Major trunk airlines will boost gross revenues and net incomes but trouble looms ahead for local service firms and nonscheduled operators.

The electronics industry sold \$3 billion worth of military equipment in 1953, mostly avionics. This year will see further expansion of both military and commercial avionics markets. Guided missiles development and manufacturing, already approaching the rank of a billion-dollar industry, will operate at about its 1953 level for the foreseeable future. No really large-scale production of missiles is in sight until major development obstacles are handled.

COMMERCIAL MARKET

HELICOPTER MANUFACTURING and operations will expand during 1954 with increasing emphasis on commercial products. Both the 30-40-passenger transport helicopters and the smaller 4-6-place designs aimed at a variety of industrial and agricultural applications will enter the commercial market during 1954.

Utility aircraft production should remain steady at a 4,000-plane level during 1954. Main effort will be directed to non-engine equipment aimed at the expanding business flying market. Most of these trends should carry into 1955.

THE NEW DOCTRINE

KEY TO THE FUTURE of the aviation market, at least for the next three years, is the new airpower doctrine formulated during the closing months of 1953 by the National Security Council and endorsed by President Eisenhower. It is the blueprint for both military and civil aviation policy during the three remaining years of the President's current term. Its military application is solidified in the "new look" U. S. strategic policy now being implemented by the Defense Department. Details of the new doctrine's civil application are now being studied by the Air

Coordinating Committee in preparation of a detailed policy to be submitted to President Eisenhower. From the committee's study will emerge a new civil aviation policy to match its military counterpart.

The new strategic doctrine calls for building and maintaining two specific types of military forces. First, a force capable of swift and devastating retaliation for any major aggression. Second, mobile task forces that can function as a military "fire department" hurrying to any point on the globe to extinguish minor aggression.

DEVASTATING RETALIATION

AIRPOWER WILL DOMINATE both types of forces. For the swift and devastating retaliation deep in the enemy's heartland, the new defense doctrine will rely on atomic and hydrogen weapons delivered by the long-range bombers of the Air Force's Strategic Air Command. For the fire department task forces, airpower is required to provide the mobility to rush them to the scene of the emergency and the heavy punch necessary to blast out the fire.

The National Security Council has made it clear both to the Defense Department and to foreign nations that U. S. airpower will use atomic weapons against military targets to counter any type of future aggression. It is apparent that top policy makers have learned a lesson from the failure to use tactical atomic weapons against the Chinese Communist armies during the early phases of their aggression in Korea.

ADM. ARTHUR W. BARKER, chairman of the Joint Chiefs of Staff, also has made it clear that any discussions on maintaining superior United States airpower are based on a concept of national airpower that includes not only military aviation of the Air Force, Navy, Army and Marines, but also civil aviation resources such as the commercial airlines and the aircraft manufacturing industry.

This strategic doctrine is a new concept and its

"Today there is no argument among military planners as to the importance of airpower. Obviously, obviously and in support of other forces it is a primary requirement. Its strength continues to grow, both through increases in carrier units and through better equipment...."

"The President of the United States, the Secretary of Defense, and the Joint Chiefs of Staff are of one mind on this matter. This nation will maintain a national airpower superior to that of any other nation in the world."

—Admiral Arthur W. Barker, USN, Chairman, Joint Chiefs of Staff

implementation in regard to airpower has only begun. First effect on our national airpower have been good. The Air Force will continue its expansion program toward a goal of 132 combat wings and an entire inventory of some 22,500 modern aircraft by 1957. Naval aviation will maintain its combat strength of 16 carrier air groups plus supporting antisubmarine, patrol and transport squadrons to achieve an inventory of 9,500 modern aircraft by 1957. Army will continue its expansion of airpower to exploit the mobility of vertical envelopment. Marines will maintain their modern air wings plus a helicopter fleet for an assault.

THE MOST SERIOUS weakness apparent so far in the military implementation of the new strategic doctrine is the lack of sufficient air transport to provide the Army with the long-range mobility it needs have to do a more effective job with fewer men. However, a major reorganization of military air transport has been looking in the Pentagon and this may solve this critical airlift problem soon.

'AGE OF PEACE'

UNDER THE NEW STRATEGIC DOCTRINE United States military strength is being built primarily around atomic and hydrogen weapons and the speed of jet aircraft for delivery to the enemy. Older and more traditional armaments of warfare—tanks, land and sea—are being cutback as the air is emphasized. Defense Secretary Charles E. Wilson has indicated that airpower will claim a larger percentage of the defense budget in the future.

In addition to this shift in emphasis on the character of U. S. military strength, the new strategic doctrine also has changed its tempo. A long-range program has been set on maintaining and

modernizing adequate military forces to meet the continuing threat of what President Eisenhower has termed "an age of peril." This is in contrast to the frantic mobilization of the Korean period in reaction to a "moment of crisis."

If properly implemented this change of tempo will bring the aircraft industry closer to its long-sought goal of a stabilized long-term procurement program as a substitute for the sharp peaks and deep valleys that have marked the past 20 years. It also will bring the taxpayers closer to their goal of obtaining adequate national airpower at a reasonable cost.

JOB FOR THE FUTURE

THE FUTURE OF AMERICAN AIRPOWER has been legitimized considerably by the new strategic doctrine, but it still leaves many problems for both the aircraft manufacturers and the airlines. According to present plans, the manufacturing industry should stabilize in 1956 at a rate of about 3,000 new military planes annually plus a considerable maintenance and modification workload on military airpower already in being. The airlines will probably be given a real stake in operating many phases of the military airlift required by the new strategic doctrine.

IF THE PROMISE of the new airpower doctrine is to be converted into the reality of a national airpower that is truly second to none, a concerted effort will be required in all segments of the aircraft industry and all government officials whose responsibilities concern aviation development. This effort should be aimed at harmonizing home to the public and then elected representatives in Congress the problems in achieving the quantity and quality of airpower that is necessary for survival.

STRIKING POWER of Strategic Air Command will be strengthened by addition of long-range, high-speed Boeing B-52 Stratofortress.

Air Force Takes Key Role in U.S. Policy

New doctrine recognizes the revolution in military methods stemming from development of atomic weapons and highspeed, long-range aircraft.

By Robert Hays

The Air Force is rapidly becoming the dominant factor in United States military strategy. The new strategic doctrine of the Eisenhower administration, for the first time in American history fully recognizes the revolution in military methods wrought by the combination of atomic weapons with high-speed, long-range aircraft. As a result USAF now occupies a position as an instrument of national policy similar to that of the British Navy in the British Empire of the 19th century.

There is mounting evidence both within USAF, where a more extensive type of leadership is growing fast, and externally among top Administration policymakers and members of Congress that the full implications of this vital relationship between the quantity and quality of American airpower and the success of American policy is becoming more clearly understood.

The fiscal 1955 budget represented a definite break with the postwar

"balanced forces" concept that divided the Defense Department budget in an even three-way split among the services. The fiscal 1955 budget allocated USAF about 40% of the total Defense Department money.

Defense Secretary Charles E. Wilson has indicated that this percentage will increase in future military budgets. There are still some voices crying out from the Pentagon lobby for a return to the traditional and "more

normal" methods of waging war but these voices are diminishing both in volume and frequency.

• The Road Back—During 1954 USAF will be moving the end of a long and frenzied effort to reach the quantitative and qualitative level of airpower necessary to cope with the requirements of the new national policy. For the first time since its disintegration after World War II, USAF will be close to a state of genuine combat readiness in addition to its potential appearance.

In 1946, the year before the Korean war began, USAF was a skeleton of 42 combat wings equipped mostly with World War II surplus aircraft that were obsolete even then. By mid-century this year, USAF will reach a strength of 115 combat wings. Total plane strength will have increased from 28,000 in 1949 to 22,000.

At the same time USAF was expanding in a 1959 increase in its overall strength, it was also working with the contractors from war surplus and early vintage jet equipment to modern transport aircraft.

In place of the postwar-era F-55 and 500 mph straight wing F-80 gun of 1940, USAF fighters equipped now have 780 mph, sweptwing Sabers and will soon get improved F-100 Super Sabers. The Air Force's off-vehicle capability has progressed from slow and inefficient F-84 Twin Mustangs to stable, jet-powered, radar equipped and radar-firing interceptors such as the F-96D Scorpions, the F-94C Starfires and the F-86D. Production is already beginning in the Chevrolet F-102 supersonic delta wing all weather interceptor.

Light bomber units that went to war in Korea equipped with piston-engined B-24 Superfortresses will soon get B-77A twin jet bombers equipped to carry atomic weapons. Strategic Air Command units who fought MIG-15s in Korea with B-29s have tested their old Superfortresses for carrying B-47 mid-altitude bombers.

USAF now has close to a million men as service is training new pilots at a 7,000 annual rate, and is completing a chain of modern air bases stretching from the Arctic Circle to the African desert and literally girding the globe.

►Equal to Russia—During the next two years USAF will add 22 more combat wings to reach a level where its losses feel it will be really capable of

meeting its global commitments in the age of peace.

With its expansion program expanding at full throttle during 1958, USAF took a new look at its progress, problems and goals to revise them in favor of the new aerospace doctrine.

The true burden of expansion and modernization accelerated by the Korean war produced management problems in USAF between 1950-55 that far surpassed anything in American industrial experience both in scope and complexity. It has been formidable among some historians to the point of going so far as to call it USAF's worst methods during this time when more than \$10 billion more outlays flowed again as corporations, that was, the three of an "economy" crashback. The combination of leadership and the balance of the Third World War to outlast the 1945 gave these people new challenges and inspired by the arm which had to struggle through the hectic period of 1950-51.

In the struggle of the military services USAF will suffer from a lack of sufficient capable leadership for its expanding activities. However no service is making more strenuous efforts to develop management and technical career officers as emphasis management concepts were throughout its activities than USAF.

The full benefits from this program will not be evident for several years but it is obvious to Pentagon observers that USAF is moving in the right direction and at a fairly pace. USAF has also exhibited a willingness to modify its con-

cept and organizational structure to meet the unique problems arising from the new developments in the aerospace aviation equation.

New Program

Most important result of the 1955-57 "new look" is the program for expanding USAF to reach a strength of 17 combat wings by 1957. This program differs only slightly in numbers from the 185 wing goal authorized just after the Korean war began. Six Troop Carrier wings are the actual difference. But there has been a significant reworking of USAF's combat composition to the new 187-wing program. Here is the difference in types of units authorized under each program:

	Old	New
Strategic Air Command	57	38
Air Defense Command	29	37
Tactical Air Command	40	34
Troop Carrier Command	17	11
Total	143	147

Basic reason for this change is USAF competition in the tremendous striking power offered by the new family of atomic weapons (Atomic Weapons Aug. 17, p. 91) plus the growing threat of an environmental attack by the Russians in force equipped with atomic air thermonuclear weapons. The increase in Air Defense Command is aimed at meeting this threat particularly with the addition of six all-weather interceptor wings.

BOMBING FLIGHT making up USAF strength today includes Convair B-56 shown left in FGCUA role with Republic F-104B, Boeing B-47 Stratojet shown in formation above RB-47E and Martin B-57A, two low level intruder fighters.

►Power Weapons—The decrease in Tactical Air Command wings is possible because the new program strength of 34 wings equipped with the Republic F-84, Martin B-57A and Douglas B-66—all capable of carrying small size atomic bombs that pack the same destructive power as the weapons that devastated Nagasaki in World War II—has small growth striking power than the 40 wings previously programmed with conventional types of weapons.

The new program poses a question as to what good is achieved by reducing Strategic Air Command by two wings. Many observers believe that this trend should be reversed and an increase for SAC as in order. Most seriously point to the new program as the elimination of six Troop Carrier wings at the same time the new strategic policy calls for increased mobility for the army to compensate for its manpower cuts.

►Airline Needed—To ease Pentagon observers think two phases of the new strategic doctrine do not match. If the Army is to do its job successfully with fewer men it must have new ability to deliver the swift delivery of its strategic reserves to global trouble spots.

Other angles of the "new look" include:

►Maintenance as new base construction.

►Shift in procurement emphasis from mass production of current types to get more advanced and improved types into production.

- Shift from a policy of obligating procurement money as fast as possible by a series of orders to last beginning of fiscal contracts.
- Major reductions in space and spare parts procurement.
- Further standardization of aircraft production.

Construction Problem

The maintenance on new base construction is expected to be lifted in fiscal 1955 with a billion dollar public works bill. However, even the USAF secretary, who is the most enthusiastic about the "new look" measures, admits that considerable valuable time was lost in the USAF construction program by this maintenance. They anticipated righting this last time during 1954-55, but this goal appears too unrealistic.

USAF has a critical need for new construction not only for its global air base network but tactical and support units but also for its basic research, de-

veloped and testing facilities. The post-war technical revolution in aviation made most of its wartime bases and its aerial facilities obsolete and military budgets have not provided enough new construction to meet this critical need. The money that authorized the B-17 and Mustangs will not handle B-36s, B-47s or F-86s nor does the distribution of World War II bases meet anything but the modern training requirements for USAF.

Most of the air bases built during World War II were scattered through out the South and Southwest. The bases required now for an defense of North America and increasing international atomic air attack must be located in the northern extension of the continent and its approaches. New construction of the types required for modern jet aircraft and in the locations required by modern global strategy is a critical USAF need.

►Research Construction—Similarly the warheads that proved well for public space research are hopelessly obsolete

TOMCAT'S INTERCEPTOR is typified by the supersonic delta-wing Corsair F-102 armed with air-to-air missiles.

for the supersonic problems now confronting USAF. Modern test facilities, particularly for missiles, were previous concepts of this function and require expensive construction.

The cost of the research and development testing facilities required for the use of supersonic flight and guided missiles is so high that any serious continuation could afford to build or operate them without assurance from the government.

As the largest user of armament research and hardware it is clearly USAF's responsibility to sponsor a program to provide these facilities which are vital if this country is not to fall in maintaining technical superiority in the air.

Procurement Shift

By next July USAF will have taken delivery on about 34,000 modern aircraft produced since the beginning of the Korean War in mid-1950. This sizable movement of modern aircraft has alerted the present of obsolescence on USAF, as fewer than four years ago that units went into combat in Korea equipped with World War II vintage aircraft because their was nothing else available.

With the pressure for shorter quantity replacement need, USAF has had to take a harder look at the qualitative aspects of its equipment. During 1953 there was a thorough screening of the USAF aircraft procurement program with a new trend dominating future production of types that already were approaching obsolescence, types that would offer only marginal performance improvements over existing types; and types that appeared to be extremely costly to own-produce.

Funds received from cancellation of production contracts or removal of aircraft from active programming were used in new production of new plants that offered considerable performance improvement and had already performed sufficiently in the air to indicate they were technically sound.

► **Emphasis on Quality**—For the future, USAF procurement emphasis definitely will be on quality of equipment rather than on sheer quantity in availability. There is also a definite USAF trend to reach for large qualitative improvements through the weapons system development concept rather than relying on minor improvements through the model improvement philosophy.

One of the major clues to the use of future USAF procurement programs will be the variety of technically sound hardware ordered by the service industry.

The rate at which Air Force will acquire modernization of its aircraft inventory—another major factor in future procurement—will depend also on the rate of industrial progress achieved by the aircraft industry. A good example of this may occur in the requirement for tested aircraft where existing plans for future production could be completely upset by the appearance of a fabulously sound serial test of fighter.

Contract Changes

In its haste to obligate the billions in procurement funds suddenly dumped in its lap after Korea, USAF used letters of intent liberally. As a result an enormous backlog of contracting negotiations accumulated. Only last week did this mountain of uncontracted let-

ters of intent begin to crumble in earnest. In some cases the actual production work specified in a letter of intent was completed and delivered to USAF before a firm contract was actually negotiated. This was poor procedure for both the contractor and USAF. Policy now is to delay actual obligation of new procurement funds until a firm contract is negotiated and no letters of intent only for investigations such as modification programs or starting portions of an extremely long lead time program.

The USAF production program has been through several "stretchouts" since it was imposed in the fall of 1950 when the impact of the Korean war had generated a frenzy equal to the production expansion of World War II. These delays in acquisition were caused first by unworkable production schedules that called for output far in excess of anything that industry could actually do even if given top priority in tools, materials and manpower. They secondary cause was the unwillingness of the government to establish any effective penalties for the defense industries, including awards, on any of these three vital ingredients for accelerated production.

► **New Stretchouts**—The stretchout quietly effected by USAF during 1953 was not based on the aircraft industry's inability to meet military production schedules. By now purpose was to avoid the production program indefinitely to eliminate the peak and valley that was slowing the industry in 1954-55. Industry could have easily reached the original production peak scheduled for 1954. But if this industry had accepted the industry would have gone from this peak into

Until the F-102 is in service.

a logarithmic slide downward into 1955 and 1956 that would have meant closing some plants, loss of large quantities of production workers and a financial debilitation almost as bad as the 1946-48 period.

Now the production peak has been squeezed all into a plateau extending through 1953 and the downward re-dosed to a more gentle slope reaching into 1956.

The 1953 stretchout was reluctantly tolerated to meet such company's specific needs and should do much to reduce the elements of instability in the aircraft production future.

When USAF began its post-Korean expansion program there was little operational experience available on which to base future requirements for spare and spare parts programs for jet aircraft. Since the jet engine was still in its early infancy operationally when the production expansion program was initiated, USAF planners allowed generous margins to meet future spare requirements. Operational experience of the past three years, particularly in Korea combat, combined with a rapid rate of technical progress, now make it possible to revise spare requirements on the basis of more factual data. During 1953 USAF was able to save close to a billion dollars by reducing its spare requirements and spare inventory will be even more substantial. There are still large areas ripe for further economy in the spare program, depot operations and maintenance procedures and USAF is now trying to probe along these lines.

► **Fortune Combination**—There have been more attempts to assign credit for the "new look" taken during 1953 to a specific source but Pentagon ob-

TODAY'S INTERCEPTORS will be the sophisticated Lockheed F-94C.

the technical gap until successful next-generation missiles are operational.

The status-bound carrying fighter can ride underneath the B-36 during most of an intercontinental trip and then cut loose just outside the range of the Russian target defense interception for a surprise penetration of the target.

If the fighter can locate the B-36 another day, it can look on as a fight for the entire trip. If not, the trade of an atomic bomb successfully delivered as target for a fighter retreat and pilot in good safety leaves.

Radar Puck-Lane-TICOM also will probably be used for long-range reconnaissance penetrations of enemy territory and as an early warning device.

The latter application would use the B-36 mother ship well equipped with airborne search radar and functioning as a picket plane along the perimeter of enemy territory.

When undetected aircraft are located on the B-36 radar, the parent fighter can be cut loose for work in conjunction. If the target is identified as an aircraft, the parent can not lose with a lethal blast of rockets as to no return missile such as the Falcon to make the kill.

Hillbush Comes—Although the B-47 quickly is taking over as the standard SAC medium bomber, the venerable B-36 is still as only heavy bomber. The B-36 fleet is likely to remain in active service for a good many more years with duty as a radio picket plane, airborne command center for FICOM fighters and possible as an aerial tanker for jet bombers.

For the immediate future, the B-36 fleet probably will be the only carrier capable of handling the hydrogen bombs. First there-after that do not yet exploded at Bikini was shown the size of a CCA trailer and mobile ramp

can be set up expected to be much smaller for some time. Hence, it appears the B-36 is the only SAC bomber that will have sufficient load bay volume for hydrogen weapons in the immediate future.

It is expected that the B-52 Stratofortress will be equipped to carry hydrogen bombs, but it will not be as any appreciable SAC service before 1957.

Target Penetration—SAC's basic approach to its problem of target penetration appears to be expansion to carry hydrogen bombs, but it will not be as any appreciable SAC service before 1957.

Current SAC bombers, such as the B-47 and B-36 as well as future development such as the B-52 and B-59 super-sonic Hustler, are aimed at high-altitude penetration. But they lack under development as aerial versions of an airborne, low-level strategic bomber aimed at making penetrations below the scope of radar detection.

Supersonic Bomber—For at least another five years, SAC will be dependent on subsonic bombers with a possibility that first target penetrations can be made by either TICOM fighters or air-to-ground guided missiles such as the Bell B-43 Bused in the final phase of

this period. After that, development is heading toward the supersonic bomber, of which the Convair B-58 Hustler is the principal project now on the staff.

After the supersonic bomber, the strategic role probably will fall to the intercontinental ballistic missile. There is some responsible opinion in military circles that too much development effort is being devoted to long-range aircraft development and not enough to bringing the long-range ballistic missile into the realm of a practical weapon.

USAF is sponsoring development of the Constellation and the North American Nucleon as a means of long-range missile.

Air Defense

Building an effective air defense system is a relatively new task for USAF. Except for the early phase of its participation in World War II, USAF was engaged primarily in offensive action—protecting the borders of its defense as the enemy.

Neither the Germans nor the Japanese ever developed a strategic air defense power. Now there is ample evidence to show that the Russians are making a determined effort to build a long-range strategic bombing force capable of delivering their atomic and hydrogen weapons over intercontinental ranges.

USAF now is faced with the problem of constructing an air defense system that will blunt and pierce any possible thrusts of the Russian strategic air force against North American targets.

Technical Review—The present trend in technical forces the offense and places an extraordinary technical burden on the defense. Since World War II, the

volume of an area available to the offense has doubled with the rise in bomber altitudes from 25,000 to 50,000 ft.

Bomber speed has increased from much more than 300 mph to 650-700 mph and current defense fighters are the unenviable victims of the increasing speed range.

Increased Defense—Not much more than a year ago Gen. Carl Spaatz, then USAF Chief of Staff, estimated the continental air defense system would not be able to destroy more than 30% of an attacking bomber force before they reached their targets—even after the defensive system had been bolstered to its maximum capability and effectiveness.

Now even USAF staff now a going into air defense problems that when the general public, they still is a case for optimism in that endeavor. SAC bombers successfully practice bombing key American cities almost every night in the week, despite the best efforts of the air defense system to locate and intercept them. However, the venerable B-36 is a classic target for the interception now available to USAF and Navy fighter squadrons.

Principal problems in building an effective continental air defense system are:

• **Warning**—Early warning radar network still is slowly and can be easily penetrated. Ground reference stations in the Arctic are extremely vulnerable to enemy air attack. Radar picket aircraft are not yet ready for active operations along the Arctic and ocean approaches to North America.

U.S. and Canada still have not agreed on mutual obligations over the type and location of early warning radar facilities. Major USAF effort is being devoted to solving technical problems of processing a semi-continuous flow of ground environment data as an air defense system that will gather, analyze and transmit data on an attacking force directly to airborne interception and early intercept operations.

• **Interception**—Most USAF intercept air now in service do not have either the range or speed to intercept attacking bombers of sufficient distance from the target to make effective attacks before bombs are dropped. Range also is a basic weakness of the automatic radar system operating on the ground. The Arctic's Nike anti-aircraft missile has found the extent of whether the contribution of Nike battalions supposedly to defend U.S. cities against bomber threats is little more than extremely expensive Army playgrounds.

The F-94D and F-94C have recently limited range and operational time at the altitude where they meet

struck enemy bombers. The F-94D has longer range, but there is a growing feeling as some USAF circles that what really is needed is an aircraft type that could function in the air as much as a Navy destroyer does at sea. This type aircraft would be equipped with long-range airborne radar to locate enemy bombers, sufficient range to cause them a long way from their target and enough maneuver to conduct a running battle with them in the manner that submarine wolf-packs forced to survive at sea.

• **Weak Fighters**—USAF still is looking large numbers of day fighters in proportion to its production of all-weather interceptors. This trend causes drastic development of all-weather interceptors with performance equal to or better than that of day fighter counterparts. Very seriously has abandoned the day fighter category for future fighters and is concentrating all its new, improved fighters with all-weather capabilities.

Another weakness in U.S. defense has been their traditional design for offensive rather than defensive capabilities. In contrast, the design of the Russian MIG-15 emphasized its defensive role as a high-altitude interceptor, featuring fast rate of climb, heavy armament and high-altitude performance.

• **Tactical Future**—The future of tactical

air defense is the expense of its characteristics as an offensive fighter bomber.

Defense in Politics—A defense of the North American continent also has become entwined with domestic politics and considerable pressure is being exerted on USAF, particularly from the most vulnerable population centers of the Northeast and Northwest, to devote a large share of its effort to de-fense of the cities.

USAF policy has not veered from primary emphasis on its long-range intercontinental bombers as the best assurance against enemy air attacks, but it shows signs of bending slightly in the face of the political pressure for an umbrella of air defense.

Military men are aware, as the politicians are not, that an air defense system never can be built that will provide an invulnerable protective umbrella over American cities. Any de-fenseless means an attack with atomic weapons will cause tremendous destruction despite the best defensive efforts. All an air defense system can hope to do is to boost the cost of an attack so high that an enemy will hesitate to pay it at all, or if he does, extract such a heavy strain on his attacking forces that he will lack the resources to sustain the attack.

• **Tactical Future**—The future of tactical

GRUMMAN COUGAR banking down on carrier deck symbolizes power's technical advance in carrier-based aircraft design.

NAVY

Naval Aviation Makes Rapid Progress

New developments in anti-submarine warfare, FTO interceptors and helicopters spur jet-propelled resurgence of carrier-based airpower.

Naval aviation, after lagging behind in the development and production of new aircraft, during 1955 made rapid gains and today 70% of the planes in the Navy's 16 carrier air groups are jet-powered.

Developments during the year include:

- Vertical takeoff interceptors. Three years ago the Navy held a design competition for VTOL interceptors and contracts were awarded to Convair and Lockheed. The Convair model, XFV-1, is a delta-wing aircraft. Lockheed's XFV-2 is a straight wing model. The XFV-1 has already flown successfully and Navy plans vertical test flights soon. Both are powered by the Allison F40 turbojet rated at 5,500 chp, with counter-rotating propellers. The planes do not require any other power for takeoff. If the plane lives up to its predictions, Navy feels VTOL could be the greatest advancement in fighter aircraft since the jet engine. A major role for VTOLs in carrier duty, close-support work and in defense of a beachhead.
- Douglas F4D Skyray, which will be entering into operational service with

first units by the end of the year, set a world speed record of 3,520 mph over the 1,500-mi course at Thermal, Calif. The Skyray is Navy's latest clap fighter, and production models will be equipped with Pratt & Whitney Aircraft's J57 engine. Westinghouse engines were used in the prototype.

- Powerplant difficulties eased. Much of Navy's troubles in new plane came from industrial problems with jet engines. The Westinghouse J46 engine

will be replaced by the Allison J71, and while there is no engine planned to replace the Westinghouse J46, Navy is looking heavily on the P&W's J75 and Corbin Wright's J67, still under design. No other engine Navy is watching closely. As far as powerplants are concerned, Navy feels it is "out of the woods."

- Resurgence of water-based aircraft. After a seven-year Navy hydroaerodynamic development program, the F2V-1 Sea Dart made its first flight last April off San Diego Bay. Other major development in water-based aircraft is the four-engine R3V Tridented. Its high-speed, blended-wing design has helped put it in a good class with land-based aircraft. It's as close as Corsair aircraft.

- First F9H-4N Demon production model delivered to Navy. The new dual-purpose, all-weather fighter and fighter-bomber is being built in quantity by McDonnell, and has undergone extensive carrier tests. The first 30 Demos will be powered by the Westing-

house J40 with afterburner, but the manufacturer will have Allison J71 engines. Operational units will receive the F9H within a year. McDonnell is also building a Demon model capable of launching missiles.

- Convair 52F is now in production. It is a "single-package" aircraft combining the land and attack functions of the AF-26 and the AF-27W for anti-submarine warfare.

- Douglas A1A, a two-jet attack bomber, made its first production flight last fall. The plane's power comes from two J57-P3 engines, and provides the Navy with a high-speed long-range carrier-based aircraft. Squadrons will be equipped with the new bomber in less than a year. Although the Navy is quick to point out that nearly all small aircraft have atomic launch delivery capability, the ASD will have a major role in this vital assignment. It is now going through board of operations and survey tests.

- Operational deliveries of the Chance Vought F7U-3 are being made. Although engine production difficulties delayed the Cougar program, Navy is confident that the bi-tail fighter will prove a versatile aircraft. A missile launching model is also being produced. Production of the F7U will be phased out sometime this year, and the A2U will be put on the line.

- Helicopter emerged from a purely

"paper circulator" in the mask of a present subsonic surface factor, with current tests checking its maneuvering capabilities.

► **Contingency Problem**—Navy's "plan in the stores," as one officer called it, is the F2V Sea Dart. Shown in its development during the past year but some high Navy brass is less glib about its outcome. However, progress, though slow, is encouraging for such a radical new design.

Designed in 1951 the fast, water-based fighter has not met what seems are now calling an answer intractable for it. Construction of the hydro-lifting gear is the big problem and changes are expected this year after rough water tests are completed.

Forefront in this problem. Possessed by two Washington 145 turbojets, the Sea Dart does not yet have sufficient thrust. Engineers on the project expect to see the aircraft go into production with a single engine, possibly either the Pratt & Whitney J57 or Allison J71 turbine. All are agreed that many problems remain to be solved before the F2V is production bound.

Much are interested in the delta, supersonic fighter as tactical air cover for amphibious or offshore assault. Big advantage of the ship to the Navy would be its flexibility and its maximum requirements for industry loss.

Glen L. Martin now is working on another design of this type for Navy

Strategy

Navy's role in today's global strategy is explained by Adm. Robert B. Carney, Chief of Naval Operations.

"Situated in its simplest terms, the Navy's traditional job has been, and will be, to give and maintain control of the sea. More specifically, the U. S. Navy in cooperation with Allied naval forces must exercise positive control over those sea areas needed for our

GRUMMAN PF4F work completed wing joints heads shore Douglas F3D Strikings.

own seas and those other sea areas of critical importance to the enemy. The Navy will also have collateral tasks in support of the army and air forces, and these additional responsibilities may be expected to increase with the Navy's ever-increasing range of tactical influence."

New Carriers

The attack carrier force, composed of 16 air groups operating from 14 carriers, is the backbone of Navy's striking power. These classes of attack carriers are in operation today: The *Midway*, the *Oriskany* and the *Essex* classes. The *Essex* will be replaced within a year by the *Essex* class, which is similar to the *Essex* but has the steam catapult and higher capacity landing gear. There are today, three *Midway* carriers, one *Oriskany* and five *Essex*-class ships operational.

► **Fast Patroler Class**—The first of the *Forster* class, named in due to be completed in July 1955. Second *Forster* class carrier, the *Saratoga*, is scheduled for completion in February 1956. Contract was let last month for construction

team of a third of this class, and Navy's fiscal 1955 appropriation request contains money for a fourth. Navy had planned to put reactor engines in the fourth carrier, but the idea has been abandoned and conventional engines will be used.

The first carriers will have catapult decks which permit a two-carrier operation.

Navy says that in flight operations during the past months aboard the control deck carrier *Archibald* more than 5,000 landings were made during daylight darkness and low visibility without a single hazard accident. The dramatic catapult, separate arresting gear and control decks have had a strong effect on Naval aviation, permitting operations of supersonic fighters and attack planes from carriers.

Navy air groups range in size from about 70 to 118 planes, depending on the carrier they are working from and the group mission.

► **Push in 1955**—The overall program, Navy has adjusted its sights for the long pull. The peak of aircraft deliveries, rate set at 100 per month in mid 1954, has been scaled down to

BY RIGHT REFUELING contact is made between probe of Grumman F4F and Douglas trailing from North American AJ aerial tanker.

a peak delivery rate of 250 aircraft monthly to be reached early in 1955. The delivery rate then will decline slowly.

In pilot training, Navy is raising its pool of 3,200 pilots for fiscal 1954, and 3,180 are scheduled to be trained during fiscal 1955. The loss of 100 is due to a drop in the number of foreign pilots being trained under MIAAP.

The Marine Corps is allotted about 1,000 pilots from the training program and Navy gets about 1,900. Recruits are Coast Guard and NITAF pilots. Marine pilots are three wings assigned to the three Marine divisions.

ASW Progress

Big accomplishment during the past year in the secreted anti-submarine warfare phase of naval air operations was the gradual development of the team concept between air, ship and submarine divisions. Members of the three groups are outstretched on each other in clearing the sea lanes, are now working more closely together than ever before. ASW has come of age.

Test of Navy's work in that field comes this spring in a gigantic *Albatross* maneuvers which officials on all three

branches are now finally getting their feet on the ground.

Start of deliveries at the end of 1953 of two different model helicopters—specifically designed for ASW work helped bring this about. These are the Bell 188, and Sikorski S-18 captain. To date, Navy hasn't found any other category which meet its needs for ASW.

► **Assigned to Units**—The Bell copier is now in production and undergoing leather tests at Patuxent Naval Air Station, Md. The first production models are being assigned to ASW units. After some delay the Sikorski copier will soon join the fleet.

Both are equipped with armament de-tection gear. Tests on this low delivered to Navy prove the helicopter has a permanent role in the phase of anti-sub operations. Further copiers were used experimentally, but their role of point was their weakness.

Plans shown control the engine in the dipping and lowering movements of ASW copiers requires more rugged powerplants than now available in other models.

► **Scouting Operations**—Helicopters are to be used primarily in groups in one way, usually being ahead of Navy com or used in regular search and

scout. Navy looks forward to replacing later models with designs which can detect in well at dusk every subs.

Experiments are being carried out at Patuxent City, Fla., to test the helicopter's capabilities as a man-overboard lifeline, as being run on dummies, back cables (though the water is not, same team).

Comparing with Navy's traditional habit of keeping everything possible on new aircraft to further experiments, submarines are also being placed in the new carrier-based copiers. The idea will see the introduction of a British model submarine, the T1946A, which will be used until Navy comes up with bigger improved model. Present U. S. model, submarines are not discarded and thus unprepared in the present state of anti-sub warfare.

► **Submarine's Role**—Accretion has been placed on the use of submarines in the past few years. Submerged submarines offer remote radio signals by standard airborne search radar. With subs having dropped into the water from the air, detection is simplified.

During the past year, the carrier-based *Grampus* is SIF power all its tests with firing cables and is now being introduced into the fleet in equally as

TURBOPROP TRANSDUCED is Carrier RIV, 58-ton, 550-hp. long boat now under evolution for logistic support of fleet units.

NAVY TRANSPORT for high-speed maneuvers by an Lockheed Super Constellation powered by Wright Turbo Compound R3350s.

Germany can produce the ten-engine aircraft. The R3350s made its first appearance in 1952. Last year's tests, including extensive flight trials aboard the USS Constellation in the summer, caused Navy to bank heavily on the ship. It is powered by two Wright R3350 Cyclone engines.

► **Neptune**—Last year also saw the introduction of jet pods to the Lockheed P2V Neptune series of patrol bombers. This land-based aircraft has been fitted with two Westinghouse J34 turbojets, one under each wing, to supplement its two Wright Turbo Compound piston engines. This is probably Navy's first serious use of Westinghouse turbojets.

In the streamlined version—the P2V-7—the replacement piston power is used to speed the bomber to its target and

boost again. Over the enemy target, its compound engines—minus the turbojet thrust—hold the bomber to a slower speed. Navy says the P2V-7 suits aerial for some time to come.

Another plane high on Navy's radar for ASW is the Martin P5M Martin powered by two Wright R3350 Compound engines. A seaplane, the P5M went into squadron service in 1952 and last year was performing heavy duty. Navy's request for the P5M points up the current statement of Navy thinking toward the seaplane. A new Martin seaplane, the P5M, is jet-powered and designed as a minehunter.

► **Duty for Blimps**—Blimps, the lighter-than-air craft which Navy has long used against subs, began last year to take over a vital role in the ASW pro-

gram. Principal model now is the Goodyear ZEPH, which is heavily loaded with sonar and other detecting devices as well as torpedoes.

Earlier thinking on the blimp restricted its use to coastal areas. But with the increase in the size of the new models, they are acquiring greater range. The ZEPHs are being given added responsibility for convoy protection, although few have been built that far. An even bigger, longer-range blimp is the M2, which is now being tested at Key West, Fla., indicating that Navy considers the blimp of ever-increasing importance.

► **Use 11 Constellation**—ASW carrier operations are carried on currently from the decks of five Essex-class carriers and six of the smaller "keel"-type carriers, so named because of their size. The five Essex-class have not been converted to the angled-deck principle.

The angled-deck concept is not easy for ASW operations. Present thinking is that the Essex-class carrier is as large as will be necessary.

► **Seaplane Tests**—In the increased emphasis on seaplane aircraft, Navy rolled out its Grumman R3V Eureka seaplane passenger ship late in the year and the big ship made its initial flight tests last month.

Powered by four Allison T40 turboprops, the 50-ton long-range transport has a speed of more than 370 mph. Observers believe it will have important commercial applications.

Navy expects expect great things from the R3V in logistic support for the fleet. Evaluation flights will be continued throughout the next several months in San Diego Bay, after which the ship will be flown to Portsmouth, Md., for further tests.

Present success of the seaplane air craft will bring development this year in special equipment and testing for seaplane all-weather and landing gear. Navy has that type of aircraft in place in Navy's test for years to come.

Stafoam Plastic Allows Radar Energy Transmission Up to 99% in F-94C Radome

With double accuracy, Lockheed's shock Stafoam can simultaneously aim and fire up to 48 radars, any one of which could knock out the biggest bomber flying. The bullet-shaped radome, or nose, houses the sensitive radar scanner that tracks down the prey. Its effectiveness in allowing the radar beam to pass through unimpeded is due to the use of Stafoam in the construction of the radome itself.

Inexpensive Stafoam Provides Sufficient Strength and Rigidity to Radome Yet Offers Negligible Resistance to Radar Beam—

The terrific radar fire power of Lockheed's super F-94C fighters (48 radars including wing pods) would be largely wasted without the sensitive, precisely accurate radar firing mechanism housed in the radome.

The radome, well must be manufactured with infinite precision to allow the radar scanner mounted inside of it to operate effectively. More important, the materials used for the radome must, of necessity, allow the electrical magnetic beam to pass through without being deflected, distorted or impeded. The radome can be compared to an optical lens—where the physical characteristics of the material influence the efficiency in the transmission of rays.

Stafoam is poured into a mold held with thin fibreglass polymeric shells. After the Stafoam solidifies and is cured, it is securely bonded to the fibreglass laminates forming a light weight rugged sandwich almost 3/10 inch thick.

Stafoam Now Used In Structural, Insulation and Safety Fields

In addition to its structural use for aerial construction the many varied types of Stafoams make it applicable to almost every other industry. Its limitless range of hard to soft forms and its slow flex recovery, make it especially suited to the impact and cushion field. Also, because of its low thermal conductivity rate, it is superior for insulation.

The bullet-shaped radome, just removed from the mold, holds the exact contour during curing. The slow shrinkage required for an effective radar make it the alternative for durable age or exposure.

Stafoam is Easy to Mix and Pour

One of the most remarkable characteristics of Stafoam is its simplicity of application. By merely pouring the contents of one container at a given formulation into another container and gently mixing for several seconds, the correct balance is obtained for the exact consistency and density desired. And, it never varies. By following the very simple directions, any non-skilled employee may apply Stafoam to your product. With Stafoam, there is no measuring or weighing necessary. The exact proportion of the two ingredients can be predetermined by American Latex for you—and packaged ready to mix and pour. Some formulations allow for self curing, thus eliminating the necessity for costly cures.

In spite of the critical importance allowed in the finished radome, Stafoam can only be handled by unskilled help. After two employees are pouring liquid Stafoam into mold. Within seconds their work is done and the mold is ready for the next pour.

Before Stafoam can be used, heating from the sides of the mold. Within a very few minutes it starts to set. Completely cured (after about a 15 minute heat cycle). The Stafoam bonds the two thin layers of fibreglass into one together.

Lockheed Tests Prove Stafoam Has Exceptional Strength to Weight Ratio

Because of Stafoam's superior strength to weight ratio, Lockheed Aircraft Corporation has now found many well suited uses for it. A case in point is its application at Lockheed as a structural filler for rocket engine casings, aircraft filter, antenna

housings, shock absorbers, and many other. Stafoam has been used in many other applications. The self-curing of Stafoam is of a non-conducting type, making it stronger, buoyant and corrosion resistant.

NOTICE!

Although the information contained in this advertisement covers only one application, Stafoam is supplied in hundreds of densities, textures, hard and soft with applications for almost every industry.

Some formulations allow self curing, others provide for heat curing at a maximum of 300°F.

For more general information on this truly versatile foam plus the uses for our Stafoam line, write for our Stafoam brochure at the following address:

American Latex Products Corp.

3341 West El Segundo Boulevard
Burbank, California

Stafoam is Self Bonding to Most Materials

The bonding qualities of Stafoam during curing, however, the rapid easy to pull away from the materials surrounding it. This important feature not only makes Stafoam a superior insulating substance, but more important, it becomes an integral part of a structural unit. Loads are distributed equally, thus adding tremendous strength to any unit containing Stafoam.

The bonding quality of Stafoam is another reason why it is perfectly adapted to Lockheed's F-94C radome. It combines the two fibreglass laminates into a single lightweight unit.

After a two-hour curing period in the mold, the radome can be removed for pouring.

Stafoam, a registered trademark of American Latex Products Corp., is manufactured under "Lockheed" patents owned by Lockheed Aircraft Corp., Burbank, Calif. "Registered trademark of Lockheed Aircraft Corporation."

DOUGLAS GLOBEMASTER II provides air mobility for heavy Army equipment including tanks, heavy artillery, bulldozers and trucks.

Army Puts New Stress on Air Mobility

By G. J. McAllister

ARMY HELICOPTER squadrons bring swift supply to combat troops in rough terrain.

A new concept welding airpower strategically and tactically to ground forces and their equipment is rapidly gaining force in the Army's staff councils.

The concept endorses two distinct weapons:

- **The strategic airlift.** This provides for transport of troops and equipment over long distances, giving the Army a strategic mobility that goes beyond the tactical air drop. The airlift task would be carried out by the Air Force.

- **The tactical airlift.** This mission, confined to the ground fighting zone, is handled by Army aircraft under the direction of the Army field commander and calls for short-range helicopter lift of men and supplies. In addition, observation, reconnaissance, casualty evacuation and such operations as winch-lifting are part of the task.

The strategic airlift concept was pushed effectively by Earl D. Johnson, an engineering and fiscalist agency advocate, when he was named to the Army secretariat in 1950. Johnson is now president of the Air Transport Association.

- **"There for One."** The key to our plans must be mobility—fast, dependable, even person capacity for mobility, land, sea and air mobility—mobility which is capable of reinforcing and not dropping means intelligence, Johnson believes.

We need—and desperately need—the

FIELD TELEPHONE, via can be laid in 120 mph from capes or bases planes.

ARMY

present material that Army engineers. The Corps of Engineers has developed a "library" of its transportable equipment. Helicopters, grates, cranes and air compressors have been designed to the present capabilities of airlift. Experiments in the use of such equipment have been only partially successful. In the metals field, engineers with its strength, lightness and resistance to corrosion is under intensive study. Half the weight of steel and possessing the same strength, aluminum models of such basic military equipment as motor busplates have been produced. Projects for titanium fabrications of vehicles are excellent.

► **Concern Over C-119's** The Army is disturbed over the recent "new look" decision that cut the troop carrier wings to 11 from the 17 contained in the former USAF C-119 wing three. Army has been pressing for an increase in the original 17 wing and for troop carriers. With a cut in both passenger and adult wings, the Army is deeply concerned over its ability to meet its global needs since the present strategy is to make up the lack of transportation advantage through expensive airlift.

At Force today is processing the C-119 and the C-120 from Ford, the C-119 and C-121 from Douglas and the C-120 from Lockheed. Progress of the 100,000-lb-per-hour prototype (XC-112 helicopter) Douglas is building is being followed closely.

USAF at the secretariat level is also studying the effect of airlift on logistics.

► **Cuts Taken, Cost-Auxiliary Services** at the Air Force Regency Level are: "The Air Force is doing a great deal of work in the logistics field. An excellent example of this is of course, mobility, and since United States air power has become global in scope, we feel that there is much to be done and we are attacking the problem with great energy. The strategic, under the small military supply facilities, the engine packages from manufacturers to depot across the sea and from depot to user is about 200 days. The current cost for an engine module 1200" supply is approximately \$100,000 and provides the opportunity for real reduction in the cost of military operations."

"Improved procedures, better equipment, and airlift instead of transport in surface personnel and other resources are essential in national but greater mobility as well."

"For every four tons shipped to the field with three tons contributed in fuel supplies. The balance is in packaging and crating. Better crating or, better yet, no crating at all where an engine can be counted upon, after more than 40 years of service to the transporter for more support at a lower cost."

► **Exhausted 16,000 Wounded** With new metals and new concepts for efficient utilization of aircraft, Army today is busy studying the great losses of Korean operations. Army plans for 500,000 in Korea at understanding 140,000 combat missions of reconnaissance and military spotting. Army needs about 10,000 casualties from the battlefield.

A sensitive diary of the operations of the 65th Helicopter Co in Korea using H-19 relates the capabilities of Army aviation.

It became the duty of the unit to supply those operations on the line with food, fuel and ammunition for a period of three days. Forward helicopter broke ground, dug through mud and snow. The choppers made 150 sorties in and from the most dangerous in the front lines.

"Total showed that our helicopter company—not even full strength—had worked an astounding 622,644 lb of supplies. They had worked their way through 4,450 miles between the division supply points and the front-line doughboys."

► **Today's Lineup—Army aviation today is based on four types of aircraft:**

- Two-place Scoutwing (H-33)
- Multi-engine Scoutwing (H-33)
- Utility helicopter (H-19, H-23, H-27)
- Cargo helicopter (H-19, H-23, H-27)

Assignment of these assets to divisions breaks down to 11 non-plate Scoutwing planes, three multi-engine Scoutwing craft and 10 utility helicopters for each division. These assets are used to provide reconnaissance in the division commander and staff, communications and transportation in other locations.

► **Third Dimension—In addition, non-divisional assets such as engineer combat groups, troop and medical helicopter battalions and transportation helicopter companies are provided with organic aircraft. Larger number goes to the transportation helicopter companies, which have 21 cargo helicopter each. Army has an inventory of about 1,000 aircraft.**

Use of Army aircraft has added a real third dimension to the Army mission. Helicopters have proven extremely valuable in engineering, communications, logistics, they are used to select transportation points and transport parties to inaccessible locations. One helicopter operating with a rescue party in Alaska last winter was permitted to partly to rescue such work in one day that otherwise could have required 20 days to perform as Army report shows.

Use of aircraft with ground units is a more means of controlling tank operations, and provides aerial fire support from the ground units from the rear.

ARMY

BELL LIAISON copiers send the enemy and direct movements of Army tanks

developed the technique of living with by liaison planes and helicopters. The extreme helicopter set required by Gold forces involves a rugged support operation for the men who must get down wide across mountains and other forbidding, dangerous terrain. Helicopters today can fly over almost any terrain at speeds up to 100 mph.

Experiments are being conducted today to put the poles in by helicopter with aerial pumps splicing the poles into the earth after being dropped. In Korea, a Signal Corps battalion commander estimated that one aircraft permitted him to take 20 poles off the road for messenger service.

Army is putting on line chips on the helicopters, particularly the UH-1H, which can carry 28 fully-equipped men into battle. They are sharing Sikorsky's last put with the Marine Corps.

Communications research has been sponsored by Army funds financing the XV-11, XV-2 and XV-3 projects.

Observation Solution—The communications today is directly a research aircraft," says Lt. Col. Robert K. Williams, chief of the Army Aviation

Section, G-3 (Operations). "That already we are it as an excellent solution to our observation aircraft problem—a plane that can take off in zero space and have the forward speed advantage of fixed-wing aircraft. We do not see the communications today replacing the cargo helicopter."

The Army has its own pilot corps to fly its aircraft. To meet the demand—currently about 1,000 a year—Army trainees complete grade officers already experienced in their basic areas such as artillery, infantry, engineer. The Army figures that most of its missions call for them with a background of experience in the operations served by Army planes.

These pilots are given frequent tours of ground duty to provide them with opportunities to keep up with progress in their basic areas.

There are still several areas of USAF-Army relationships that require close coordination. Army looks to shared control in aviation research, development and procurement. It is also dependent on USAF for technical support and the bulk of aircraft required to provide general mobility.

ON HAVILLAND BRAVERS proved warhorse liaison plane in rugged Korea

Heat bellows, heater life tests and out log of large capacity vibration systems are carried out in the special new laboratory in Fairbairn's Columbia plant

Soundproofed viewing and control room for test (top left) is completely equipped to control and record complete data on equipment under test

Major's the word here. In this unit completely controlled room, studies some vibration tests and development work on shock of engine equipment for liaison function is accomplished under actual circumstances.

Test setup to determine the effects of vibration on aircraft engines. In this special lab section, displacements as large as one inch and accelerations as high as 1,000 g could be simulated on the test unit.

what goes on here?

—and in the background, main test area where testing equipment is stored and ground under simulated service conditions. Only a few of the testing facilities are shown here. Fundamental research is Surface Construction, Tokyo. One plant helps in the solution of every aircraft construction problem, literally before they arise. Not one overlooks the application experience of Janitrol's field engineers. Janitrol—in the design stage—solves aircraft construction and heat transfer problems. Later and better.

AVOID 3000-PSI SYSTEM TROUBLE . . .

Use Parker's air receiver

"Here are two 3000-psi aircraft system components. You'll want to know all about . . . a lightweight air receiver and a high-performance accumulator," says Bud Knox, Manager of the Hydraulic Valve Division at Parker Aircraft Co. "Let me show you why:

"For pneumatic systems, Parker's new air receivers are safe and durable. They passed the 30-ounce gun-fire test without dentation. Although they're built entirely of 4130 steel, it's the way they're made that is the secret.

"The 100 cu. in. production unit weighs only 4.2 lbs. and the 260 only 5.8 lbs. Other sizes will soon follow.

"For any application where you need stored high-pressure gas . . . pneumatic systems, emergency systems, purging, or the like, why not use these new Parker units?

Mail the coupon for complete details about either the air receiver or accumulator.

"For hydraulic systems, Parker's accumulators have been providing over two years' service.

"The balanced inner-cylinder centers the piston and seal. Air pressure is applied equally to both sides of the inner-cylinder wall. Thus, the piston moves in a cylinder that always stays exactly the same diameter over its entire length. There can be no bending to cause excessive O-ring wear. Leakage is practically eliminated.

"Parker accumulators meet all of the requirements of Specification MIL-A-5498, Revision B. All standard sizes are now in production."

WE'VE DISCOVERED HOW TO Shrink your motors -by Floating a screw on a stream of balls!

We eliminate the need for the excess power that was added to overcome friction in the old ball-bearing screw-type drives.

Ball-screw actuators made by Cleveland Pneumatic have an efficiency as high as 90% on many types of drives for machines. This lets you use a 3-horse-power motor instead of a 4-horse... a 3-horse instead of a 10... more power to spin.

It's done by replacing the famous old high-friction Acme thread principle with a special ball-bearing thread that does wonders for efficiency. Sliding friction is replaced by the rolling action of the screw and steel balls in the threads.

These "AEROL" Ball-Screw Actuators are at work now... in the air at scores of spots on air-

craft, on the ground in machine tools, in research equipment, on trucks and cars, at secret locations on difficult defense projects.

We can also cut down friction in your designs and products... by shrinking the size of motors, saving the effort it takes to hand-crank a device, making super-quiet electric tools get done in a more precise stopping point under any condition. Our Actuators operate smoothly under the greatest extremes of heat and cold.

When can we discuss with you the application of our AEROL Ball-Screw Actuators in your business? If you wish to know more about Cleveland Pneumatic Actuators and their uses... write for our booklet.

RAIL-ROAD ACTUATORS • AIR-SEA INFANTRY ASSISTERS
World's Largest Manufacturer of Aircraft Landing Gear

TO CUSHION SHOCK

CPT's shock absorber principle combines pneumatic and hydraulic cushioning. True control without rebound or loss of support. It is the shock absorber that the latest aircraft landing gear (CPT's) in the world, a lightest and strongest of landing gear, has the latest shock absorber now selected in latest aircraft. The only design with no loss in life. The shock absorber of emergency class made out of aluminum.

■ NATO

Airpower is West's Weakest Link In NATO Defense Against Reds

(McGraw Hill World News)

Paris—High-ranking Allied officers have warned repeatedly during the last year that the greatest military weakness of the Western nations arrayed against the communist East is in airpower. More than a column of words, this brief warning points out the key role that airpower is expected to play in the defense of Western Europe.

Actually an reputable officer at Supreme Headquarters Allied Europe in Europe (SHAPE) doubts that the Allied air forces could give an excellent account of themselves in any scrap with the Russians. The chances are the Communists would take a sound licking.

► **Cool, But Not Enough**—that is the atomic world that is not good enough. Western strategy is based on achieving an equally complete and absolute air superiority in possible. The West must be superior in the air to protect Western cities from destruction and to afford its ground troops the cover and close support they actually would need in order to hold back a massive Russian attack.

The actions of the North Atlantic Treaty Organization (NATO), of which SHAPE is the military headquarters, are steadily building an increasingly powerful Allied air force in Europe. This force is still far short of the goal that has been set for it but it compares favorably with the force Russia could throw against it.

► **What Reds Have**—Allied intelligence estimates that Russia and her satellites have an air fleet of some 23,000 planes. Of the total only 5,000 to 10,000 could be used in an attack against the nations of Western Europe because of the limitations imposed by the number of available airfields and by Russian operations in the Far East and elsewhere.

► **What NATO Has**—NATO air forces now have a few more than 5,000 planes. This total will be increased 50% to about 8,000 planes by the end of this year.

These figures do not include U. S. strategic bombers in Britain and French bombers, a substantial part of the British Royal Air Force, or eight squadrons of the French Air Force in France and North Africa which would be available in an emergency but have not been considered by NATO command.

The NATO air forces will be strengthened considerably this year, however, by the appearance of three new, high performance interceptors. The French Dassault Mystere and the

British Hawker Hunter and Super-voice Swift will be flying into squadrons across before the end of the year.

It is estimated that the NATO air forces will get a total of about 3,000 new planes during this year. About half of these new planes will be used to replace older equipment. The other half will go to make up the planned increase to 8,000 planes in the NATO command.

► **The Able Gamewit**—But number of planes does not a poor measure of the strength of an air force. Tactics, training and the intricate complex of ground screens that support and direct the air force in action are at least equally important. And it is in the field of operational efficiency that the West could reasonably expect to hold the bag advantage over a Communist enemy.

Allied officers have paid out that the best score of the Korean war shows the United Nations fleet shot down 13 or 14 Korean planes for every U. N. plane lost. At the same time, U. N. air forces dominated the sky over the battlefield.

It is completely true that it might be hard to find a U. N. lost soldier who ever saw an enemy plane.

American believe that almost fabulous record is largely the result of the superior operational efficiency of the U. N. air force. Experts conclude that is the NATO-15 the Communists had a good plane. But they were weak in tactics, gunnery, training and ground operations.

► **Three-Year Program**—A major part of the building of the military strength of NATO air forces during the last three years has been directed toward the goal of making that the West still enjoy the same margin of operational efficiency in the air as U. N. forces did in Korea. Excellent progress already has been made in that highly complicated task.

When Gen Eisenhower assumed command of SHAPE three years ago, there were only 15 airfields on the continent of Europe capable of handling jet planes and available for military use. Now NATO has more than 120 air fields, and 40 more are programmed in

"The Biggest Part of My Job is SERVICE..."

The TMI representative operates in precision using his precision business who need and expect the best every fact of the way. And that precision starts right from scratch, right from the start plan for the operations of the right equipment for the specific job at hand.

With TMI equipment on your side, you have a definite advantage over the man who is satisfied with the use of "average" tubing.

That advantage starts with the designer and the engineer in your plant working with TMI specialists. It starts with nothing short of superior production with less machinery, less labor time, less scrap at the inspection table.

Manufacturers use the results of TMI research on their pipe sheet... and on the reputation of their product making for their company.

"Name Time Specify TMI".

ASCOP

Now Available! Complete Time Division Multiplex Data Systems

Standardized equipment is now available for complete systems for multifunctional data transmission over a single radio link or monitoring on a single magnetic tape track, using time division multiplexing and pulse width coding. ASCOP systems engineers can now choose from a complete line of units for sampling, coding, transmitting, receiving, monitoring, recording, reducing, and recording to assemble systems to meet your data transmission or recording problems.

Pulse width data systems provide, through time division multiplexing, a large number of identical data channels of moderate frequency response. The handling of information in the form of time rather than amplitude allows accurate operation independent of the characteristics of the transmitting or receiving medium. Utilization of new and readily available channels affords continuous automatic system calibration and avoids the need for frequent manual adjustment.

A typical standard ASCOP PW system handles 20 separate data channels with 5 CPS response per channel with overall system accuracy, from original data source to final reduced output record, of better than 1%. Real time output of each channel is available as a meter reading and as continuous record from a direct writing recorder.

ROTARY SAMPLING SWITCHES

Over 40 models, single and multiple, with up to 180 contacts per pole and speeds up to 180 RPS. For all applications requiring high quality switching of low level signals. Bulletin SC-16.

Your inquiries are invited. Please, write to the nearest office, advising us of your requirements.

Applied Science Corp. of Princeton

Cablevision 1-4707

See Us at the I.R.E. Show • 204-208 Instruments Ave.

MODEL TX-84, DC-W4 PW/TM AIRBORNE SET

Uses a 30 RPS converter to sample 21 data sources in the 0 to -2 volt range. 4 to 3 watt crystal-controlled RF transmitter or frequency modulated. Displayed in coded and precoded for both channel operation, and selectively without temperature from -40° F to +140° F, 120% shock, and 50g vibration. Receiving equipment in use only in such other sampling rate and number of channels and in different package for separate applications. Bulletin 184-1.

M SERIES PW GROUND STATION

Receives and reduces all data channels in real time. Operates on signals from standard airborne set. From PW/TM, airborne set, or from magnetic tape recorder. Bulletin M-4.

MODELS APA-1 RF PREAMPLIFIER AND AMC-1 MULTICOUPLER

Increase receiving gain and reduce noise figure for long range RF link systems without increasing transmitter power. Period conversion of up to 4 dB, receiver, tested to different parameters, to the same without. Bulletin APA-1.

■ NATO

are being built at the present time. Communications, too, have been greatly improved. Hundreds of miles of landlines for exclusively military use have been laid, and a radio net with the most modern equipment has been put into operation. In addition, good progress has been made in standardizing communications procedures and training in all NATO nations.

To date NATO has spent about \$1 billion on what is called "infrastructure"—radio communications facilities, towers, barracks, etc. Another \$500 million will be spent by the end of 1956. The heavy share of these funds has been accounted for as force multipliers in the largest way possible. ■ **Fast Facilities**—The new NATO will spend \$350 million on infrastructure, about half of it to complete underground facilities at NATO airfields and to build 3,750 miles of pipelines to carry oil fed from ports on the Atlantic and Mediterranean to the network of airfields in northern France.

One of these new NATO pipelines will run from Marseilles to the Rhine river. The other will connect at Haifa and run east. They will supplement a third pipeline to be built under such U.S. funds which will start at St. Nazaire and terminate at Metz.

These pipelines will be completed somewhere next year. They will be connected to underground storage depots at airfields and at strategically located "fuel farms" which can serve several airfields. Fuel supply today is probably the most serious weakness of the NATO air force.

■ **All-Weather Fighters**—Another of NATO's major air problems, however, will not be so easily solved. This is the lack of all-weather fighters in NATO air forces. America regards this as a serious weakness, but hold one little hope it can be corrected soon.

Allied officers have doubt that any USAF jets equipped with E-94s, or other all-weather fighters, will be sent to Europe at least for several months. The operation of all-weather fighter squadrons will require months of special training in the air forces of most NATO nations before such squadrons could go into service, even with the planes likely to be available soon.

■ **Border Patrol**—The air forces under NATO command include no long-range bombers and only a few light bombers like the British Canberra. The big offensive punch available to the West as an emergency is the American B-47, many of which are operating from bases in Britain and Morocco.

Although there are no study NATO command, these B-47s are a major element in the West's growing power.

Missile Program Depends On What U. S. Can Afford

Re-evaluation of tomorrow's weapons shows that future costs of all present projects may be too great a drain on national economy.

By David A. Anderson

The entire future of guided missiles in this country hangs on a slender green chain of dollar bills.

The plain facts are that we cannot afford to produce all the missiles now in several stages of development throughout the country. We cannot afford to keep all the research and development establishments going to back up all the projects. We cannot afford to keep firing a variety of speed-pursue test vehicles. We couldn't possibly afford an all-out offensive with the new weapons.

In short, the missile has grown to 10 years from a cheap, expendable throw-away missile of low-grade steel to a complex metallic organism which now consumes as much as a conventional airplane designed to do roughly the same job.

■ Old Problem, New Concerns—That isn't a brand new problem. Ever since there has been a missile program in this country, people close to it have worried as they watched costs skyrocket. They have always believed that such worries could ever be obtained from a missile program which jeopardized the question of alternate costs.

But no official action was taken on any recent issue. It remained for the new look¹ as defense policy in general to cast another view of the dollar value of the missile program.

Under the leadership of Terro Good

son, special assistant for research and development at the USAF, a committee examined the expensive missile industry. They heard plans, talked to engineers and managers, heard presentations. Then they collected and wrote an interim report, now in the hands of Donald Charles, assistant secretary of the Air Force for research and development.

That report is dynamic. It spells out the problems for every one of the half-dozen missile or component projects currently under way in this country. It separates the sheep from the goats.

It examines the mission in the single missile question which determines future missile policy of the United States.

■ What kind of missiles can we afford?

■ Long Overlook—This kind of approach

B-44 MATADOR BOARS OFF rail-launcher and into climb to cruise altitude.

to the problem is long overdue, second only to those in the missile business. In the past, funds to get going on development and production of the new missile weapons of the future, there was little concern with ultimate costs. They was, in fact, little concern with any long-range planning.

Then K. J. Keller, chairman of the board of Chrysler Motors, was called on to handle the transition from research and development into production. His main mission was to get production projects forward up to tangible hardware.

The industry was "defunded," as missile production was ordered for three missiles. Later, others joined the select two. One of the last arrivals on Keller's list was Redstone, an Army Ordnance missile which is to be produced in quantity under a multi-million dollar contract, by Chrysler.

Keller last week worried out, as much as he could. The fact that so few production quantities of more missiles today, and will have more tomorrow, is due in great measure to his brotherhood approach.

■ Guided Group—The first job of the Guided Committee was to find duplication in the Air Force guided missile program. That duty was later extended to cover the projects being carried on by all the services.

Still later, Guided's counterpart was asked to consider itself nonexclusive in the entire missile program. They were to name the most promising projects in research, development and production.

Details of the Guided report are highly classified, as are most phases of the missile program. Some indication of the magnitude of the Guided Committee's work can be gotten from the accompanying tabulation of missile projects.

In more detail than the table permits, those following paragraphs describe some of the current missile programs.

Air-to-Air

Original concept of so-to-be guided and propelled missiles paralleled other look to two tactical trials used by Luftwaffe fighter aircraft during World War II. Kept at a respectful distance by the overwhelming defensive firepower of the bomber force, the fighter planes used unconventional approaches.

Small sagged solid-propellant field rockets known as the IRAM were fired in salvo from a lone fighter formation either ahead or to one side of the bomber box.

Large liquidation bombs, with time-delay fuses were dropped into the bomber box, from above.

Both tactics had limited success. The fighter force still too far away to achieve the necessary accuracy. So guided weapons were rushed into development, and at the end of the war, there was arrival of these new type weapons that were undergoing tests in the Luftwaffe's experimental range.

■ Pulse Missiles—In the United States, the first pulse work on AAMs was typified by Ryan Aircraft's Firebird. This first missile set the formidable barrier for most of those that came after. Measuring about 10 ft long and 6 in. in diameter, Firebird achieved limited success. The program was completed, but the bird never went into production.

In general, this class of missile is intended to replace fighter or bomber armaments. Related to the sagged solid-propellant rockets, AAMs are in a size and shape class with Firebird. Most of them are solid-propellant rocket

motors and are subsonic. Speed at launch of the rocket charge is about Mach 3.

■ Hughes F-98 Falcons, the USAF now in production at Hughes' Tucson, Ariz., plant, Falcons is to be paired with the Convair F-101 interceptor as man-steer for the supersonic fighter. A typical configuration of the Falcons would pair the missiles in underlying rocket propulsion is provided by a solid-propellant motor-rocket imp speed in Mach 3.

■ Sperry Sparrows, for Navy B-44s. Actually, there are several Sparrows, made by combinations of companies including Sperry Gyroscope, Raytheon Manufacturing Co., and Douglas Aircraft. Early versions have been built by Douglas, but mass production is to come from Sperry's new plant at Bristol, Tenn. Sparrows cost little more and test in an early version, and weighed about 100 lb. Power comes from a solid-propellant motor, and burnout speed is about Mach 3.0. Range is about five miles.

■ Matra Goshawk, for Navy B-44s. The point-blank this missile is a short-range, powered, 1,500-lb bird, carrying a distance of 30 mi at Mach 3. This is not at the usual low-altitude of AAMs, but any statement a different approach to the problem of aerial destruction. Size and shape indicate that Goshawk is intended to use long-range interceptors, to knock enemy bombers, not fighters, out of the sky.

■ Bell Meteor, for Navy B-44s. Meteor originated under a contract with Massachusetts Institute of Technology for a missile, MIT was in still in other companies for development and production of laboratory studies. In with MIT were Federal Telecommunications Lab, where the guidance system was de-

Speed is achieved with fuel separator drive.

MISSILES

aircraft—combined with wings and tail sections which belated and controlled the missile during its drop. On impact, wings and tail dropped off, and the housing segments sped on alone.

There has been an official mention of one U-2 missile in this category, but at least one is known to exist.

• **Fairchild Perrel, for Navy BuDef.** Powered by the lightweight, expendable Fairchild H-9 rocket, Perrel is one of a series of smaller missiles aimed after diving birds. Design of the series originated with the National Bureau of Standards. Naval usage have teamed with Perrel, and production of Fairchild's Guided Missile Division, Wyandwich, Long Island, has satisfied the need of training duties.

Surface-to-Air

Second in importance only to the long-range surface-to-surface missile, the anti-aircraft weapons in this category range from the simplicity of LoLa, an unguided solid-propellant rocket, to the F-99 Bounce, a complete air defense system of which the guidance subsystem is only a part.

• **Active and Passive—Guidance system** also has the power of sophistication. At one end is the "passive" type, directed toward by extensive ground radar which do the work and tell the missile to go right, left, up or down. The beam-riding system is one example of this, in it, the beam rides the center of a radar beam, much as a tug drifts along the center of a stream.

At the other end of the scale is an "active" guidance system, which most engineers feel is too large to get into a missile. It would be a completely self-contained system, which could locate the target, and home in on it without any reference to ground-collected data. This is the ultimate.

There is a middle ground, called "semi-active," a guidance scheme used in the Fairchild LoLa, for one example. Details have not been released, but one kind of semi-active system would call for firing the missile against a predicted flight path, but in the air by data from a ground radar tracking the target. When the missile sensed the thousands of intercept point, small internal beam-riding units would take over and guide the missile to the target.

These are the SAM prospects of current interest.

• **Fairchild LoLa, for Navy BuDef.** Rocket-propelled and featuring a semi-active guidance system controlled by enemy to be ahead of its time, the LoLa now is out of production. There are still a few LoLa in the hands of training units. LoLa used rectangular wings

and tail surfaces rotated in that they were 45 deg. out of plane to each other. Powerplant was a Bumblebee Motor, Inc., liquid rocket engine. Speed was subsonic, limited to Mach 0.9.

• **Cosmojet, for Navy BuDef.** Also called the LoLa, was tested in November 1955, May 12, 1957, p. 12.

• **Comet Toward, for Navy BuDef.** Introduced as a shipboard defense weapon, Comet is one of a family developed under a Section T contract between Navy and the Applied Physics Laboratory of Johns Hopkins University. The contract, under the code name of Bumblebee, has produced a large number of test vehicles and at least three missiles—Comet, Titan and Typhoon. Comet went into production at General Motors plant early in June 1955. It is a coasted boost, with trapezoidal wings and control surfaces. Structure rocket motor is a solid propellant, less jet exit.

Comet is about 1,800 lb., with solid-propellant booster attached. Range is on the order of 30 miles, top speed is about Mach 2.

• **Dauphin Nike, for Army Ordnance.** Originally designed to cope with bombers in the class of the Boeing B-29, Nike requirements never were updated to keep pace with technological developments. As a result, the missile is well-suited for service in production quantities, but could not shoot down most of the enemy's bomber fleet. Chief value of Nike is as propaganda for the Army and to keep reconnaissance looking into, say, jet stream.

With stall range of 35 mi Nike could only reach out to strike aircraft before to the Boeing B-47. Against a high-speed bomber, its performance would be doubtful. Nike, propelled by an Aerojet liquid-propellant rocket engine and rendered a solid-fuel booster for launching, it had proved a delta control quantity. Guidance is beam-riding. Co-developed with the Dauphin (airborne), Western Electric and Bell Telephone (Aviation Week Dec. 26, 1955, p. 13).

• **Bounce F-99 Bounce, for USAR.** Bounce is a complete air-defense system, involving much more than the development of the problem interceptor bearing the F-99 designation. An offshoot of the GFM weapons which was cut out from under Bounce in 1948, Bounce has drawn heavily on the earlier project and surface development.

From the early project released, Bounce appears to have both solid and liquid powerplant. Layout is conventional, using a single tapered missile and trapezoidal tail surfaces. Weight is about 1,800 lb. and top speed is about Mach 2.5.

In doing by the report, Bounce bands in subsonic, this concept is unique among missiles, which generally use two sets of lifting surface in right angles and

HYATT BEARINGS!

HYATT

HYATT BEARINGS DIVISION • HYATT BEARINGS CORPORATION • BOSTON, U.S.A.

Hyatt brought bearing speed, and superiority to the air. But for the engine builders, they brought problems. With higher speeds came higher operating temperatures, and engine parts, especially bearings, had to be designed to withstand destructive heat. So designers turned to Hyatt. With unrivaled research and development facilities, modern production equipment, and years of experience, Hyatt was a natural choice. Hyatt bearings assure highest quality in mass production, and since 1945 Hyatt has been a major supplier of jet bearings. It is a design requirement as beyond the capabilities of ordinary bearings, always call on Hyatt.

Profile list of aircraft equiped with Hyatt jet and turbo jet engines, using Hyatt Bearings.

Hartwell Flush Latches

AVAILABLE
FOR OVER

300

COMBINATIONS
OF DOOR & FRAME
THICKNESSES

BACK
VIEW

HARTWELL Transportation Flush Latches are produced in over 300 standard combinations of bolt and trigger offset. We now provide a link for any door to be locked in any door without otherwise being connected to standard door seal pieces.

No amount of punch and frame is necessary when HARTWELL Flush Latches are installed. Offset of bolt and trigger are managed on each part for rapid and accurate selection of the correct lock for each application. All HARTWELL Flush Latches and triggers are the result of nearly two decades of continuous specialized design and manufacturing.

MISSILES

production of the Redstone missile, originally designed by a group of ex-German scientists now in the U.S. at the Army's Redstone Arsenal, Huntsville, Ala. Part of Redstone's technical backing was information on language concept and rocket missile design turned over to the group by General Electric's Project Hermes. "That experience may have found application in the Redstone missile."

- **Lockheed for the Hercules.** This short stage missile is intended for close support of Marine assault forces. It is powered by a reciprocating engine, has a range of about eight miles.
- **General Electric Buques A-3, for Army Ordnance.** This designation applies to one of a series of Hermes missile under development by GE engineers for Ordnance. Some version of the series is believed. The Hercules program includes considerable test development work in propulsion and guidance, as well as specific applications to missiles (Aviation Week Feb. 8, p. 26).
- **General Electric Buques A-3, for Army Ordnance.** Another will test secret Regal like the Regal's Regal, several after a first regenerative shot was a language missile design incorporating an integral Minuteman engine. General Electric says it now has no secret contract, so it is presumed that Regal is either inactive or soon canceled.
- **Convair Atlas, for USAF.** This is a very language interest in several ballistic missile development in Convair study and test program with the MX-774 project.

Test and Research

The test and research studies are the backbone. Unquestionably, even mapping to the eye, the body test vehicle at the solid foundation on which every missile program has built.

There have been vehicle vehicles, hooded by a solid propellant rocket to check rough flight characteristics during launch. Some have been small scale models of the big thing, as in the Hercules B tests. Some have been converted into missiles—the Corporal is one example.

Combined with instrumentation and with sensors replaced by atomic gas, early production missiles have been converted into test birds. There has been an extreme view, held by some missile engineers, who say that every flight is a test flight.

• **Big and Small—Any table of missile missiles is necessarily incomplete. To a rocket engineer, a 5-in. scale model with a test probe and five channels of telemetry information is a test vehicle as much as is the 42 ft. ancestor of test birds, the Minuteman Viking.**

You simply can't hit the hands

of test vehicles under the Huntsville program, which included Corbin (for "combined up next," and one captured) and one which was almost missed into the, after the order of the final at based) and as an indication of its behavior. Boeing's GAFA program is parallel test rocket tests, NACA has conducted several with rocket-powered vehicles for several years. This was NATIV (for North American Test Instrumentation Vehicle) and MX-774, a brilliant test missile by Convair.

Most of these have been made obsolete by changes in programs or new developments in expanded methods of calculation. They flourished in the early postwar missile period.

Today these are the test and research missiles of interest. In USAF, Navy and Army. Another has been used since 1947 for a variety of jobs mostly connected with upper-atmosphere research. It is 20 ft. long, 15 in. in diameter, weighs 1,600 lb. including the booster at launch. Acceptor developed the rocket and its engine, a liquid-propellant type (Aviation Week Feb. 8, p. 33).

• **Douglas Buques, for Army Ordnance.** Douglas built the modified nose of the V-2 rocket which served as the first stage of the two-stage high-altitude probe. Original design came from the Jet Propulsion Laboratory at CalTech, passed through the ex-Pennsylvania scientists then at Ft. Bliss, Tex., and went to General Electric, where project responsibility was placed.

Beeper is a combined WAC Corporal and V-2, at basement of the V-2, the WAC is fired and its velocity and altitude performance are added to those of the V-2. Beeper model No. 2 established a 270-mi. altitude record. Several Beeper models were the first two-stage liquid-propellant rockets ever fired in launching solid-propellant vehicles. Minuteman, had been built and fired by the Germans during the war.

• **General Electric Buques A-3, for Army Ordnance.** The A-3 was a missile test vehicle for test-to-vehicle missiles developed on the Hermes project, but after Germany was built to the design of a German sub-rocket missile, the C3 B2 Wasserfall. Two changes were made in the lowest Wasserfall's wings were clipped and the air sudden vent of deflated duct. Internally everything was different. A low density wire built and tested by GE.

• **Lockheed X-7, for USAF.** This is reported to be in capsule test vehicle for Minuteman and Wagon. Aeronautical research project.

• **North American X-10, for USAF.** This is a test vehicle for the North American Hermes missile probably intended for development of the guidance system.

• **Minuteman Viking, for NRL.** This Vio

maintenance-free, heavy duty

A.C. TO D.C. REGULATED

POWER SUPPLIES

For better

VOLTAGE REGULATION

from poor present DC conversion with

HUFFORD ROTA-MAG

The new Huffed Rota-Mag set improves performance of all D.C. systems by providing superior voltage regulation up to the full generator capacity.

With variable generator preference, as required in electronic characteristics in the full output power available.

OTA-MAG is complete, self-contained unit to convert it may be selected for any power and output voltage.

REGULATED D.C. power has been generated recently.

REMARK: X-7 rocket was installed in full load.

Directly available

HUFFORD MACHINE WORKS, INC.

- For production line testing
- Laboratory testing
- pre-flight check-out of electronic equipment
- engine starting
- welding, electro-plating, etc.

Huffed Electronic Division assumes a complete line of heavy duty, regulated D.C. power supplies. Available in portable or stationary type, these units operate from either 220 or 440 vac, 3 phase, 60 cycle A.C. input and are available in any desired output voltage and current ratings.

features

EXCELLENT VOLTAGE REGULATION—Within $\pm 1\%$ from no load to full load, with line voltage fluctuations of $\pm 10\%$.

FAST RESPONSE—Recovery time under extreme load changes within 0.2 seconds.

LOW VIBRATION—Filter action effectively removes A.C. ripple to less than 1.5 c.m.

These power supplies are equipped with superior amplifier voltage regulation which are wide free, extremely rugged, reliable and completely insensitive to vibration, changes in temperature and humidity.

Each is furnished as cooling system (liquid or air) operation at full load. General design emphasizes ease, in-line assembly and wiring, improving assembly ability of all components. Construction and reduced response to gridly given.

DC-7 NEVER BEFORE

such Magnificence . . . such Power
such Performance!

and NEVER BEFORE has the
A. W. HAYDON COMPANY been so
proud of its contribution...

In the never-ending conquest of the vast horizons of space and time, Douglas goes ever forward meeting every challenge that men and machines must face. The newest—and brightest—star in the aviation firmament, the Douglas DC-7, is truly a miracle of the mastery of men over machines . . . and in this great work sixteen A. W. Haydon timing devices play an important part.

We at A. W. Haydon take pride in our contribution toward bringing a union of metal and machinery into integrated performance which meets Douglas' high standards. Integrated performance is born of a multitude of small component parts, working in perfect mechanical and electrical coordination. The A. W. Haydon precision timing instruments are a vital part of this vast network.

DOUGLAS DC-7, the ultimate in comfortable and safe air travel. Swift, luxurious, dependable—the new DOUGLAS DC-7 justly deserves the accolades it is receiving.

- ✓ A. W. Haydon Time Delay Relay is a very important component of the automatic prop. fueling system.
- ✓ A. W. Haydon Time Delay Relay times duration of prop. fueling.
- ✓ A. W. Haydon Repeat Cycle Timer is a vital part of the prop. fueling equipment.
- ✓ A. W. Haydon D.C. Timing Motors are used in the engine synchronization systems.

Working with us reveals

MISSILES

ing has probably the best success record of any of the current crop of missiles. Manufactured on a build-and-fly basis by Martin for the Naval Research Lab, the Viking design stress laid up that latest test information can be fed back into the design of the next model. Viking was completely changed with model No. 2, its weapons ratio was reduced and delta fins replaced the trapezoidal ones. The single-stage rocket altitude record of 136 miles is held currently by Viking.

What About Tomorrow?

All these are milestones on a mainline road which stretches back about 10 years in time and at least four billion dollars in money. None of the milestones in production today is expected at anything like the effectiveness expected by its designers.

But if we had to push the bottom tomorrow, we could send some missiles off in the direction of the enemy. To that extent, there has been progress.

But what of the industry needed to back up a large-scale use of these missiles? Could the country produce enough hardware in the future to justify dropping a missile around that propellant tank?

How many FV-117s can we afford to build and throw away with only one usage? How many electron tubes? How much platinum, gold, silver, tungsten, copper, chlorine, cobalt?

In short, what is the guided missile going to cost—not per unit—but per ounce?

VIKING 9 leads for altitude record.

First jet-to-jet refueling, accomplished with Probe and Drogue equipment built by Flight Refueling Inc.

PROBE and DROGUE REFUELING

Azimuth, light is weight. FR equipment enables us spread crew outside, provide simultaneous refueling of several fighters.

FR package equipment, quickly mounted in hook bay, turns location into fighters, gives emergency-based fighters for greater range.

The latest, simplest, most adaptable in flight refueling method is Flight Refueling's Probe and Drogue system perfected after twenty years of experiment and development.

Pioneering in refueling—which adds great range to the usefulness of jet flight—has been the singular task of the Flight Refueling organization. FR equipment made possible the first non-stop round-the-world flight, the first non-stop trans-Atlantic jet flight, the first refueled combat operations and now the first jet-to-jet aerial refueling.

To meet increased requirements, a new modern plant is nearing completion at Baltimore's huge Friendship Airport and will soon be producing FR Probe and Drogue equipment at a greatly accelerated rate.

TUPOLEV 100

ILYUSHIN 98

Aviation Week Sources Behind Iron Curtain Reveal . . .

Reds Put Muscle on Strategic Air Arm

Production of two new turboprop bombers, continuing replacement of obsolescent planes, and new development projects underline formidable airpower effort.

The Russians are putting a major development and production program behind their slowly growing strategic bombing force as an effort to develop a formidable capability for delivering atomic and hydrogen bombs on intercontinental targets.

Although the bulk of the operational Russian bomber strength now based in the European and Arctic Arctic is still piston-engine Tupolev-4 types copied from the Boeing B-29, a new turboprop bomber similar to the Convair B-56 is already in squadron service and another sweeping turboprop bomber is in production (Aviation Week Feb. 15 p. 12).

At the same time the long-range bomber production program is averaging into high gear, facilities of the Russian and Communist satellite factories that have been turning out the MIG-15 fighter at an extraordinary rate are being retooled for large-scale production of a new jet fighter.

This buildup in the officers' estimate of Red airpower was predicted consistently in this magazine more than three years ago (Aviation Week Feb. 26, 1951, p. 174). It has been conducted at great speed and under rigid security conditions. The closely guarded bomber development program has produced two new intercontinental weapons.

• **Tupolev-100.** The long-range heavy bomber is powered by six turboprop engines and greatly resembles the Convair B-56. The Tu-100 also features a wide bombing arc. This bomber is already in squadron service, but estimates of the total number produced vary from

less than 300 to several hundred.

• **Ilyushin-38.** This is a new sweeping bomber powered by four turboprops of the same type used in the Tu-100. The I-38 is also equipped with a radar bombing system and is known to be in production. It falls about midway between the Boeing B-47 and B-52 in size.

These two advanced designs are backed up by a fleet of about 700 aging but operational Tu-4s, Tupolev's copy of the Boeing B-29.

The Tu-4 fleet is now deployed at bases on Kamchatka and other points along the coast of the North Soviet seafront into the Arctic toward North America. It is backed by a mass of several hundred additional Tu-4s not assigned to operational units.

But the Reds have not neglected the defense aspects of airpower in favor of the bomber fleet. During the past few months three seven-seater Russian

fighters have been reported by Aviation Week sources behind the Iron Curtain.

• **Lavochkin 17** modification for ground support, powered by a single turbojet and carrying a two-man crew. Armament is four 23-mm cannons.

• **Ilyushin 35-2** light bomber, developed as a major modification from the I-26 series. There is now a prototype, but otherwise resembles its predecessor.

• **MIG-17** all-weather fighter, radar-aided intercept modification of the MIG-15 of Korean type. First month last 25 units, current.

• **Lavochkin flying-boat** fighter, a two-seat, single jet intercontinental craft.

• **Rockel** intercepter, based on the Japanese 6-251, a production development of the German Me-463.

• **All-weather fighter** with swept-back wings, drawing heavily on German wartime secrets on winging design. Plans for two jets, span about 55 ft.

• **Delta-wing medium bomber**, powered by four turbojets and spanning about 65 ft. This new design, together with the rocket intercepter and swept-back fighter, are under development by a team of ex-German designers headed by top Russian engineer Sergei Gorbunov. The team works at the Red experimental station at Tsibulovo.

• **Regulus** Bombs—Three new airplanes are not all operational. Currently the

Red air force and naval units are flying about 40 different types of fixed- and rotary-wing craft in Russia and the satellites. Some of the aircraft are new, like the intercepter bombers. Some are becoming obsolescent like the MIG-15 and the B-26 series. Some are completely outdated, such as the Pe-3 and Grom bombers.

Probably no more than a dozen of these 40 types are in actual production in the Soviet Union today.

To these piloted aircraft must be added the automatic strength of Russian missile developments. Reported at every level, from the mass copying of Russian German wartime weapons in the service status of intercontinental multi-stage rocket missiles, the Red piloted aircraft program presents a cloudy but impressive picture.

Great defense strength of the Red air force is still in the large numbers of MIG-15 variants scattered throughout the Communist sphere of influence. More than two-thirds of that strength is the older MIG-15 used in Korea. A newer model with afterburners and a greater load on North American F-86 Sabre equipment is in service in strength and replacing the older model. The MIG-17 is in fighter status is just coming into squadron service with the Reds.

The MIG-15 production program provided a surprising demonstration of Russian ability to manufacture modern high-speed jet aircraft. Although far fewer in the satellite countries were employed to augment Russian fighter production, the total MIG-15 output far exceeded the total production of the United States, Canada and Australia on the North American F-86.

Another Record-Breaking Performer
equipped with

CamLoc Fasteners

Straking over California at more than 750 miles per hour, the Douglas Navy F4D Skyray headily set a new official world's speed record. In designing panels and access doors into its sleek "skin" to minimize friction and withstand excessive loads at high speed, Douglas engineers specified Camlock Fasteners. These quarter turn fasteners not only hold with a powerful grip, but release easily and quickly for faster maintenance.

In many military and commercial plants throughout the world, Camloc Fasteners provide safer, quicker, more economical fastening.

■ RUSSIAN AIRPOWER

under the training down of engineers, manpower and material that went into the purely defensive aspects of Russian warfare, the buildup and supply of the Communist air forces in the satellite countries, and the replacement of an aircraft in Korea.

The new policy was adopted toward the end of World War II by top Russian military brass. During that conflict, the Russians in fact managed to mount very few bombing raids on Germany. These efforts showed them that such attacks were not a viable strategic bombing that blasted German industry was rubbish, showed them what airpower could do.

The atomic bombs that rocked Hiroshima and Nagasaki supplied the final lesson.

Lentini is indebted to the ground support crews, the Russia air force base in, two-winged chairs in the immediate postwar period in time to ride the coast of the postwar technology, a sizable portion of German engineers and scientists were in period and have made substantial contributions to the growth of the Soviet air force.

In retrospect it is easy to discern the tremendous effort Rama has devoted to building its postwar aerospace effort about which the United States has been duly warned but still tends to underestimate.

Since 1946 the Russians have built a fleet of long-range patrol bombers equivalent to our B-39, which are still in active service with SAC. They have produced a jet fighter force that boasts more modern sweepwing aircraft (jet) than the combined NATO powers. They have built a military air transport system equipped with twin and four-engine planes to link their extensive airline network.

They go now well along on building a fleet of gas-turbine-powered long-range bombers capable of carrying the atomic and hydrogen bombs also developed by Soviet scientists.

But just as in the case of the stone, Norah, the Nazarene, did not ignore the chance to bask about their strength.

As an award himself, general, writing in the official Moscow newspaper *Izvestia*, said that

¹In the United States, a great deal is written on the so-called global, intercontinental or trans-ocean strategy. The authors of these theoretical exercises picture a war as if their adversaries had no means of embarking on this kind of strategy.

¹⁰Would it not be wiser to consider a response?

FASTENER CORPORATION

55 Spring Valley Road, Paramus, N. Y.

WEST COAST OFFICE: 8910 WILSHIRE BLVD., LOS ANGELES, CALIF.

Skilled technicians performing one of dozens of tests on size 23 Synchrostat. Its design agent for Army Ordnance, Ketay designed all Synchrostat of this size.

James and Harrison optical comparator—one of hundreds of different methods (many of them original developments) used to insure precision.

Environmental test chamber can simulate altitudes up to 90,000 feet—produce temperature rates to minus 200°F and controlled humidity to 98%. This chamber performs all environmental tests in accordance with MIL-63272.

EXPERIENCE + RESEARCH + PERFORMANCE = LEADERSHIP

The final test of leadership is the ability to deliver Ketay offers:

Original research to meet highly specialized requirements and rigorous operating conditions. Application of this research to the economical manufacture of high quality products.

Volume production to comply with stringent delivery schedules.

By providing a complete range of sizes and types... singularity of design... facilities for volume production.

tion. Ketay has established this kind of leadership.

Ketay's experience also includes: gyro components, automatic control devices for fire control and missile systems, computers and simulators, magnetic resolver and synchro amplifiers, marine inter-communication equipment, ship's engine, solenoid and other remote pilotages, and automatic control systems.

The Research and Development Division is staffed and equipped to participate in advanced studies during the design stage of applications involving Ketay electro-mechanical devices.

MASS PRODUCTION of aircraft and components like these Boeing B-47 wing panels will reach postwar high this year.

Aircraft Manufacturing

New Doctrine Aims to Stabilize Industry

Peak deliveries scheduled for this year with gradual decline to plateau level in 1956. Future net incomes may surpass record year of 1953.

For the first time in its turbulent postwar history the aircraft manufacturing industry can look forward to a period of relative stability and high sales volume. Aircraft manufacturing will reach its postwar high-water mark during 1954. The floodtide of military orders stimulated by the Korean crisis should reach its crest of deliveries to the Air Force, Navy, Marines and Army this year and then begin a gradual decline in 1955 to reach a maintenance and modernization level in 1956. With few exceptions, weapons, engines, parts and accessory manufacturers already have enough business in their current backlogs to keep their plants busy until 1956.

During 1953 the aircraft manufacturing industry built about 155 million airplane parts, of which only 10 million parts represented civil aircraft. About 12,000 military planes were delivered, in addition to some 6,700 commercial transport and utility aircraft.

► **More Airframe Weight**—During 1954 the number of military aircraft deliveries will increase at about the 1953 level but airframe weight will continue to increase. By another 10%, at a higher percentage of heavy transport and jet bombers, and the military delivery total.

Sales, which reached about \$9 billion during 1953, will continue to climb during 1954, predicting the increase

in airframe weight. A decline of perhaps 15% in gross sales looms for 1955, but that year's sales level should still be above the extremely prosperous year of 1953.

With the expansion of the excess profits tax on Dec. 31, 1953, and gross profits for most aircraft companies to reach key areas for taxation range—about 40 percent on facilities, and research and development expenditures, and a new determination of allowable costs, it is not unlikely that net income for the industry will surpass even the record mark of 1953 in forthcoming years, despite a gradual decline in total sales volume.

► **Military Market**—The military market

will continue to be the key to the economic health of the aircraft industry.

Here at the outlook for military business under new proposed doctrine of the Republican Administration first authorized in the first federal budget (covering the fiscal year 1955) early this year.

The aircraft industry still is working on a large part of the \$40 billion appropriated for aircraft procurement in the three fiscal years after the outbreak of war in Korea. On Jan. 5, 1954, the Defense Department budgeted a total of \$27 billion in appropriated but unexpended funds for aircraft procurement. This represents work already contracted for with the industry but still not delivered or paid for. These same budgets also showed a total of \$7.6 billion available for new aircraft procurement contracts in 1954.

► **Level Shows High-Actual Spending** by the Defense Department for military aircraft (out of the \$27 billion unexpended balance) is programmed for \$9.3 billion in fiscal 1954 ending next June 30 and \$9.1 billion for fiscal 1955. This compares with \$7.5 billion spent in fiscal 1953 and \$5 billion in fiscal 1952. According to Defense Depart-

Weight delivery rate of aircraft in postwar years

Aircraft delivery rate in thousands of planes

some figures, the aircraft industry will enter fiscal 1956 on July 1, 1956, with a backlog of about \$7.7 billion in military aircraft procurement.

For an industry whose total military order volume was about 10% of that figure in 1953 this is still a pleasant prospect.

What's Ahead—While Defense Department expenditures are the best index of current business in the aircraft industry, the new obligational authority requested for aircraft procurement in each budget offers the best clue of what is likely to happen two and three years hence. By watching new obligational authority for aircraft procurement it is possible to chart a curve sliding downward from the peak of the Korean war to the level at which the aircraft industry is likely to settle.

Contracting by the military reached a peak in 1953, when about \$12 billion worth of orders were given to the aircraft industry. For fiscal 1954 a total of about \$7.7 billion is scheduled for new aircraft contracts, while fiscal 1955 is programmed for \$6.5 billion in new military aircraft business.

The \$6-billion annual aircraft procurement level, plus another billion for missiles and special aviation devices not included in aircraft costs, is about where the aircraft industry will probably emerge in 1955 after the post-Korean backlog. In dollar volume this is about two-thirds of the post-Korean peak but more than three times the level of the pre-Korean industry of 1950.

This \$6 to \$7-billion annual level is clearly forecast in the fiscal 1955 budget, because that is the first budget since the Korean war began that is based solely on a maintenance and modernization cost for the aircraft strengths already authorized for the Air Force, Navy, Marine and Army. All of the funds required for the expansion in these strength levels have been provided in previous years' appropriations (ENR 151:54).

► **5,500 Planes a Year**—Present plans call for financing about 5,500 new planes annually, to be split among the services as follows:

- USAF—3,600 planes and about 54 billion.
- Navy—1,600 planes and about \$2 billion.
- Army—about 500 million.

► **A Backward Look**—At the end of 1953 the manufacturing industry could look back on a period in history in its frantic expansion to meet the demands of World War II. The expansion triggered by the Korean war gave the industry the double burden of expanding military supplies and at the same time modernizing it to meet the technical requirements of the jet age. Looking back it is now possible to measure the in-

Purolator maintains the world's largest specialized filter research and engineering laboratories ... always ready to serve you!

Your filter problems—small or large—can always welcome at Purolator's Engineering Department.

If you find this one of the nearly one thousand types of standard Purolator® filters will fill the bill... we'll design one especially for you!

But before you decide on a custom-designed unit, you'll want to study the many kinds of Purolators available on order. The large, illustrated Purolator catalog is yours for the asking. Just mail to the coupon, indicating which ones you wish.

Whether you need one special filter, or a million of a kind... your best source is Purolator!

There's a PUROLATOR for every filter need

Auto oil	Air	Acids	Adhesives
Hydraulic fluid	Chemicals	Compressed	inks
Gasoline	Pharmaceuticals	Paints	Coatings

PUROLATOR PRODUCTS, INC.
Rahway, New Jersey and Toronto, Ontario, Canada
Longy Branch Offices Chicago, Detroit, Los Angeles

Here's the KEY to your filter problems

V2 intelligence report

ANSWERS YOUR ANTENNA PROBLEMS

GABRIEL's flush-mounted Antenna for V2 intelligence was a tough assignment.

Is yours tougher yet?

Are the supersonic speeds, the altitudes, the temperatures higher? Are the G inputs greater? Is intelligence transmission more demanding?

GABRIEL's wide aircraft experience includes every phase of antenna design and large scale production to help you meet the most severe aircraft or missile specifications.

WRITE OR PHONE—A Gabriel Antenna Specialist will consult with you problem when and where you report. Write: 17008.

Expenditures against contracts in 1953

Dollar value of new aircraft contracts in 1953

MANUFACTURING

part of this dual requirement. They are some of the things that happened:

- **Production.** Output climbed from a 1950 total of 7,600 planes, most of them piston powered, to 12,000 planes, most built of them jet-powered in 1953.
- **Employment.** Total employment started from 257,000 workers in 1950 to 758,000 in 1953.
- **Facilities.** Slightly more than 514 billion was invested in new facilities between 1950 and 1953. This compares with 53.8 billion in new facilities during the austere period 1940-45. During the 1950-53 expansion 34% of the new facilities (about \$1.2 billion) were privately financed or controlled by about 1,000 (14,420 employees) during the World War II expansion. About 55% of the post-Korean expansion was for tools and production equipment with 74% devoted to new plants.
- **Plants.** Plant cost increased from \$3 million up to \$10 in 1950 to more than \$28 million up to \$10 at the end of 1953.
- **New Tools.** With the end of actual fighting in Korea and the buildup of production facilities virtually completed it was possible for the incoming Kennedy Administration to take a new look at the military aircraft production picture and organize a new program aimed at meeting the requirements for maintaining a superior national aerospace over a 10 to 20 year period instead of the frantic mobilization to meet the threat of another world war that was expected in 1954.

The new program, designed to accommodate a number of targets created by the size of targets in the post-Korean expansion and meet the new aerospace doctrine originated by the National Security Council and President Eisenhower, has predicted these trends:

- A further slackening in production schedules.
- Cutbacks in future orders for absorbing aircraft types and more emphasis on increased production of aircraft types.
- Tighter policy on procurement of airframe and engine parts.
- Harder bargaining on new aircraft procurement contracts.
- Heavy pressure on industry to reduce production costs and return to normal production operations.
- Narrowing the production line back to the original aircraft industry and classification of more second source production on minor engines and engines.
- Increasing emphasis on industrial competition and product performance in contrast to "blockade" engineering previous.
- Tread toward development of complete weapon systems rather than in divided items of hardware such as aircraft, armament, maintenance, night vision, etc.

MANUFACTURING

► Tailored to Fit—The current statistics of production schedules has been done on a company-by-company basis instead of merely putting each firm's problems either thus or variously shape in the manner of the Trans Airplane production statistics. The aim is to get production scheduled on a realistic basis that can be handled by companies with a normal work week and will keep their production and engineering forces occupied until new models plane into the program.

A good example of how this works is the B-47 production program—launched on USAF schedule at Boeing, Douglas and Lockheed plants in Wichita, Tulsa and Marietta. The B-47 production has been stretched by about 12 months in each plant. This time will permit Boeing Wichita to phase into its B-47 production as its B-46 bomber is phased out, and Lockheed will follow its B-47 with its C-119 transport.

In each case there will be a minimum loss of production workers between programs. If earlier schedules had been followed, there would have been a gap of about 12 months during which the production forces would have had to be reduced and then rebuilt for the new program.

This principle has been applied throughout the industry on the basis of information furnished the military by

each company on its individual problems. The aim is to be able to schedule the production peak to occur at the bottom of the valley that loomed after the peak had been passed. This should add a strong element of stability to an industry that has been badly plagued by peak-and-valley production curves.

► Business Back—Another characteristic of the new Pentagon approach to aircraft manufacturing is an attempt to get military procurement back on a level business basis after the hurried and haphazardly worked policies of the Korean emergency. Many factors in this trend are:

► Abandonment of letters of intent except as an emergency procedure. Both USAF and Navy are still working hard to reduce the tremendous backlog of letters of intent accumulated in 1951 and 1952 when the program was hurried to near panic quickly into aircraft. No letters of intent are being used for new obligations except for emergency such as modification programs.

► Return to fixed-price and incentive target-type contracts. Pentagon is putting the pressure on incentives to negotiate these types of firm contracts before new procurement funds are obligated. This puts both the Pentagon and the contractor in better bargaining positions.

- **Conservative policy on primegrants payments.** Pentagon feels that since manufacturers were allowed to build excess inventories. It will now require all future payments of this type to make certain they fall within the strict limits of the law. Progress payments are permissible under USAP contracts. They are specified in Navy contracts, but policy will be more stringent than it has been.
- **Reduction of overtime operations and subcontracting.** Both of these items are expensive and add considerably to aircraft costs.
- **Lower Competition.** Although the aircraft manufacturing industry is a whole will prosper for at least the next two years, the fortunes of individual firms will fluctuate with the quality of its products. The technical revolution that began with the advent of jet power is still in full swing and more technicians who fail to match its pace with their products will inevitably pay the penalty of falling sales. Never in industrial competition history has the market for new ideas been so brisk as in the aircraft business. During the battle

with Korea, aircraft virtually every aircraft in progress was ordered into quantity production to meet the anticipated peak in 1954.

Now that emphasis has shifted to building up for the long pull, the emphasis is on quality first and quantity second. Both USAP and Navy's Bureau of Aeronautics backed more notable technical buyouts where the emphasis was on quantity at any price and both are now taking a much more conservative balanced approach to their new equipment buying. For example, USAP is currently deferring several large procurement obligations to gain the production of particular aircraft until initial flight tests have yielded sufficient technical data to indicate the plane can perform as promised.

It is inevitable that some manufacturers who have done well in the on-when-virtually everything was being produced will suffer when this industrial performance agency is applied.

The pace of aircraft development is still moving so fast that companies who are going well today may be far down the gross sales list in another three to

five years. Firms who are still small today but well equipped with aggressive scientific talent will attract to industry requirements may also maintain with equal speed and move up into the top brackets.

► **"Fast or Fading" Problem.** Ever since the sound recommendations of the Presidential Air Policy Commission, headed by Thomas K. Slaughter dominated a political big during the 1945-50 Democratic economy wave, the aircraft industry has been planning for a long-range aircraft procurement policy to avoid the "lead and lag" so shockingly demonstrated twice in the last 15 years. The full impact of how tremendously expensive the "lead and lag" cycle in terms of taxpayer dollars has never been adequately demonstrated either to the taxpayer or the representatives they elected to Congress.

► **No-Frag Attach-In.** The aircraft industry has recommended a specific impact program to both the government and industry to reduce production lead time and the cost of military aircraft procurement. These points are:

- **New contracting techniques.** Substantial savings on aircraft already in production can be realized if manufacturers are authorized to place advance orders for long-lead time components.
- **Streamlined approval procedures.** Aeronautics procurement regulations now require too many extraneous requirements to be delayed until they are specifically approved by the military procurement officials. Time required for these approvals varies from a week to three months and increases the cost of the end item and the time necessary to deliver it.
- **Reduce the number of change-orders.** More thorough evaluation of aircraft prototypes would eliminate the need for many change orders that are issued during the early stages of large-scale production.
- **Minimize simplification requirements with performance requirements.** Efforts toward standardization of critical aircraft parts and components would decrease production time and cut manufacturing costs.
- **Improve production process engineering.** Present regulations limit the amount of money a manufacturer can spend on "process engineering" during execution of a production contract. This limits the development of improved manufacturing techniques that can have factors in cutting both cost and time.
- **Production stability.** More approval can be obtained at less cost by a stable production program than by the intermittent hand-picked into "cash" programs in order to meet various international crises.

STATE OF THINGS TO COME in military avionics includes giant closed-loop super systems, typified by Project Vulcan's radio control system developed by AF Cambridge Research Center. Photos show ground-based radio (left) and electronic computer (right) and with "data link" for automatic transmission of information to aircraft and for controlling their flight paths.

Avionics and Airpower

New Techniques Buttress Avionics' Role

Trend toward giant super systems, coupled with tiny microtropic devices and developments in automation, indicates what's ahead in military avionics.

By Philip Kline

Three major trends in military avionics development, application and manufacturing stand out among the significant advances and disclosures of the past year.

- Giant super systems, for air defense, tactical air support, traffic control and landing.
- Microscopically small constructions, using radically new techniques, to reduce greatly avionics equipment size and weight.
- Automatic-factory-type production of avionics equipment.

Super Systems

The day of the military pilot flying as a lone agent in search of a target of opportunity is fast disappearing. If military aircraft are to carry out their increasingly important role in the national defense, they must be controlled like chessmen from a command headquarters which has up-to-the-minute information as to the disposition of enemy air and ground targets, as well as its own assets.

► **Aviation's** New Role—Providing centralized information and control—so centrally and positively—is the important role of avionics in military airpower. This is increasingly true for conventional air defense and tactical air support. It is the need for centralized information and control centers that is responsible for the coming era of super systems.

The super systems will employ many modes in other senses of intelligence (other than ground-based or airborne), not communications avionics to feed such intelligence into ground-based or airborne control centers, but into digital computers to analyze raw data, display boards to picture graphically the tactical situation, and finally, a data link to transmit automatically information to aircraft and control their flight path or point of bomb release.

► **Systems Under Development**—An increasing portion of our military budget is going into the development and procurement of super systems for air defense and tactical air support. Largest and most complex of these, for continental air defense, are being developed under the AF Cambridge Research Center and Massachusetts Institute of Technology's Lincoln Laboratories. Many avionics manufacturers and several other military establishments are participating in playing prominent roles in the system development.

Tactical air control systems, being developed under the Rome Air Development Center, are the first super-system attempt to apply the latest avionics technology to the difficult problem of ground support.

MICROTRONIC construction techniques under development will permit major size and weight reduction in complex airborne equipment. New Philips technique for making laminates is one step.

AUTOMATIC FACTORY for avionics has come into being reported. Photo shows one step as process at Navy-National Bureau of Standards' pilot plant, now in operation. Signal Corp and USAF also have extensive programs.

Streamlined high pressure transmitters accurately translate pressure into proportional electrical signals of extremely high accuracy.

MODEL 44120

These four in one transmitters incorporate a unique design enabling them to measure pressure, temperature, and acceleration in aircraft, ships, and automobiles. They are available in a wide range of output signals, including 4-20 mA, 0-5 V, and 0-10 V.

These four in one transmitters are available in a wide range of output signals, including 4-20 mA, 0-5 V, and 0-10 V. They are available in a wide range of output signals, including 4-20 mA, 0-5 V, and 0-10 V.

MODEL 44120

Giannini

IN AVIONICS

In one sense, these TAC systems will be miniature or delicate systems designed to protect tactical aircraft from enemy air attack. However, they must also provide for ground support operations and be designed for maximum mobility and quick setup, requirements that are not required for conventional air defense.

Super System Framework—Several months ago, USAF's Air Research & Development Command laid the security wraps off Project Volcan, a newly automatic tactical control system developed by its Cambridge Research Center, Cambridge, Mass. Jan. 28, 1955, p. 38). It provides a link in the nature of the super system to come.

Volcan's specific mission is to convert a cloud of randomly arriving air-craft, returning to base with emergency fuel tanks, into an orderly stream to their safe place, even in deeper cloudier sequence without delay at low altitudes where fuel consumption goes up by a factor of three.

Volcan consists of:

- **Search radar**, which spots all aircraft returning to base.
- **Automatic trackers** (Antennae), which rotate and track individual aircraft both, thereby converting a search radar into many tracking radars.
- **Schedule computer**, which calculates earliest, non-conflicting time of arrival for each aircraft.
- **Flight path computer**, which calculates flight path each plane must fly to arrive at scheduled time and point.
- **Continuous display** indicating required airplane heading and altitude.

When Volcan was demonstrated to the press, the flight path computer instructions were colored in human speech, over voice radio. The word "step" which has already been used extensively, is to employ a radio "data link" which automatically transmits individual flight path computer instructions to the appropriate aircraft's instrument panel or to automatic pilot.

In the latter case, the flight path computer will automatically maneuver the aircraft onto the required flight path by means of its automatic pilot, fully closing the ground-air loop.

Closed-Loop System—From a functional standpoint, a closed-loop Volcan system operating through a data link shows the principle of future super systems. The problem which Volcan solves is admittedly too difficult than trying to vector interception in fast-moving heights, or accurately predicting fraction ground targets.

From the standpoint of technology, the TAC and ADC systems may employ digital computers instead of the analog types used throughout Volcan.

► **New Digital Computer Role**—The

growth of super systems has created an important new role for large electronic digital computers, which may easily overshadow their last use as extremely high-speed versions of conventional calculating machines.

This is the application in "real-time" problems, such as traffic control, fire control, missile guidance, and so on, where which were previously in the exclusive domain of analog computers. (The translation of "digital" and "analog," easily used to distinguish between the two types of computers, is somewhat ambiguous; see digital computer footnote in analog section when solving real-time problems. Despite this, the terminology will be used here for lack of better terms.)

A real-time problem is one in which the computer receives essentially continuous data on the parameters of an ever-changing problem from which it calculates continuously an up-to-the-minute solution. For example, a radar might supply a computer with information on the bearing, height, and distance of enemy bombers and our own fighters, from which the machine would compute continuously the required intercepting heading and rate of climb.

► **Must Be Speedy**—To solve real-time problems, digital computers must be extremely fast, have reliable storage systems to hold changing information data constantly. Our machine with such capabilities is the 4300-model ERA 1103, developed by Engineering Research Associates Division of Raytheon Co. for a scheduled use by the Defense Dept. (Aerospace Week May 31, p. 67). Ken Reed says the machine can perform 14,000 additions per second, 4,000 multiplications per second.

More recently, two real-time problems which are small enough for use in large systems have been announced by Jacobs Instrument Co. (Aerospace Week Feb. 1, p. 45). The smaller of the two is capable of handling one variable input, providing three variable outputs.

All major digital computer manufacturers are believed to be working on airborne or ground-based real-time computers for defense needs, in addition to the ground-purpose machines which are playing increasingly important and useful roles in the aircraft, missile, and other industries.

► **Digital Communication**—The vast communication networks which flow from the Masterplan of the super systems impose new demands on a radio spectrum already bulging at the seams.

Information theory developed in recent years shows that most communications using conventional amplitude modulation is extremely wasteful of spectrum bandwidth. By converting speech into coded pulses (called "digital communications") for transmission, so

Facts about HELI-COIL inserts in the aircraft industry

What they are

Helicoid screw thread inserts are precision formed coils of stainless steel or aluminum bronze wire. Welded into tapped holes, they form permanent non-corrosive, strip-proof threads of outstanding strength.

How they are made

Threads appear in aluminum or magnesium when formed by Helicoid inserts are much stronger, therefore you can use smaller, lower, stronger cap screws for increased strength. For shorter cap screws, insert strength is increased by increasing length, through thicker brass, thinner flanges, and thinner wall sections.

What they are for

AS ORIGINAL COMPONENTS. Helicoid inserts are used to provide stronger, lighter fastenings, corrosion proof, wear proof, threads in all assemblies. This you tighten, form which the machine would compute continuously the required intercepting heading and rate of climb.

► **FOR REPAIRS**—When tapped threads are broken, Helicoid inserts are used to provide stronger, lighter fastenings, corrosion proof, wear proof, threads in all assemblies. This you tighten, form which the machine would compute continuously the required intercepting heading and rate of climb.

HELI-COIL

SCREW THREAD INSERTS

Here's one way you can ease the pain of cutting costs!

Leave the maximum possible only with Helicoid Screw Thread Inserts.

Here are a few of them—

They enable you to use lower or smaller fastenings by increasing the strength of each threaded assembly.

They enable you to use lower-cost fastening methods—for example, cap screws instead of nut-and-bolt or nut-and-washer assemblies.

They eliminate thread failures and thereby cut service costs in products which have to be regularly disassembled and re-assembled.

They enable you to use lower-cost materials without any loss whatever of thread integrity.

They enable you to reduce weight and maintainance.

Every one of these facts about Helicoid Inserts has been proved by their increasing successful use in airplanes, engines, electronic and electrical equipment, accessories, guided missiles.

The coupon will bring you all the facts and, if you like, a Helicoid Insert coupon can help you to solve your fastenings problem to order that exactly answers it. No obligation, naturally.

more and more leading airlines agree...

the finest airline seats are TECO-built!

Many major airlines demand for comfort, lightweight, rugged built, low maintenance air line seats have been successfully met by Transport Equipment Company

Among these, the three leading airlines appearing have modeled TECO's outstanding engineering, original styling, lightweight construction and passenger comfort to be com-

patible with their own individual requirements.

TECO ability to meet the problems and deliver on time, to complete customer satisfaction, is the reason many of our most leading airlines agree the finest airline seats are TECO-built. To solve your problems, contact problems—specify TECO, the airline seat that gives you Custom Quality at production line assembled

BAKER AIR LINES select TECO model TC-17 checked out early

TRANS-CANADA AIRLINES equipped with TECO TC-14 constant air cabin seats

TRANS WORLD AIRLINES have modeled seats in TECO model TC-13A lightweight and 9-000 pounds reinforced

TECO INC.

AVIONICS

dividual channel bandwidth can be compressed from 3,000 cps to 100 cps or less. This means that 30 channels or more channels can be provided within the same band.

There are a variety of ways in which speech can be pulse-coded. The AF Cambridge Research Center is digging deeply into the subject, to derive a versatile system in which spoken words can be pulse-coded and then decoded automatically into printed words.

If successful, a command spoken at an air defense center would appear instantly as a printed message in a console at a defense center and as a telephone-equipped aircraft. (An airborne telephone under development by the Wright Air Development Center is expected to weigh less than 50 lb. including tape reader and transmitter.) All words will be spelled phonetically, i.e., "unintelligible."

Meanwhile, work on less sophisticated forms of digital communication is being sponsored by the Rome Air Development Center. One of its contractors, Melpar, Inc., has developed a speech synthesizer which constructs intelligible speech from a pulse code having a bandwidth of only 75 cycles.

► **Pulse-Coding Advantages**—The ability to transmit and compress digitally in-flight sets in the form of printed instructions can prevent miscommunication, save precious minutes in the event of an enemy attack.

In addition to convenience, speed, and reduced bandwidth requirements there is another important advantage: Pulse-coded messages can be assembled in a wider variety of ways than is possible with present communications systems to prevent an enemy from deciphering them.

► **Data Link**—Several systems of transmitting information (not voice) by radio-code modulations are presently under development or test at AFMRC, Rome Air Development Center, and in the Navy. The advantages of pulse-coded transmissions of compressed and compressed information, called "data-link," are reduced bandwidth (or reduced transmission time) and the ability to operate with a power signal-to-noise ratio.

Data link is extended to enable tactical and air defense centers to control the flight path or bomb release point of individual aircraft via its automatic pilot. Data link will also be used to link command instructions to pilots as a special cockpit instrument.

► **Handling Super Systems**—Adapt of super systems for forward organizations like RADIC, AFMRC, and some command centers, to set up groups whose sole task is to interpret and coordinate development of the many complex sub-systems which make up a super system.

For example, RADIC has created a 100-area systems division to assess sub-system compatibility and the tactical implications of its super system.

AFMRC set up a separate system project section after a report that its important research efforts were being diverted to systems work. Cambridge has now devoted its electronics division mostly in half, with one group devoted to systems work, the other to research and component development.

► **Tough Assignment**—Finding can mean with a sufficiently broad background for super-system work is difficult. They need experience in radio, communications, computers, flight control, and tactics.

However, "It is in systems engineering that the real challenge to young engineers lies," R. J. Nardoni at WADC's assignment lab has said. "Now lead calls it 'the most demanding of any phase of the profession.'"

Microtronics

If atomic systems are getting bigger, the basic electronic building blocks are getting smaller, as well they must, particularly for airborne use. There is an increased emphasis on developing not only new components and construction techniques which are microscopically small, compared with the best previous sub-miniature techniques. AFMRC, which is sponsoring some of the work in this field, calls it "Microtronics."

► **Integrated by Transistors**—The transistor, tiny vacuum tube replacement invented an years ago by Bell Telephone Labs, triggered the microtronics movement, both with its own capabilities and by stimulating interest and research in the transistor field.

At first blush, the transistor's potent advantages of small size, light weight, low power consumption, heat dissipation, long life, made it appear to be the answer to the system engineer's prayer. But even after transistor transistors had learned the hard way, that miniature or improved scaling was needed for long trouble-free service life, there proved to be several other limitations to its use in avionics.

► **Low operating temperature**—German transistors were generally limited to operation at temperatures below 70°C. (practically all avionic equipment must be designed to operate in ambient temperatures of 55°C, frequently higher).

► **Low frequency**—Except for experimental four-terminal (triode) transistors, the device could be used only at frequencies up to a few tens of MHz, greatly limiting its radio-frequency applications.

► **Low power rating**—Maximum power rating of production transistors was in the order of a few watts at a unit.

► **Limited availability**—Because of lab-

Klystron Tubes and

WIDE RANGE REFLECTS 16 YEARS OF
EXPERIENCE IN MICROWAVE FIELD

Microline Instruments

Since 1950, when Sperry sponsored the development of the Klystron, this company has extended its application to tubes for low, medium and high-power applications. As a pioneer in microwave measuring techniques, Sperry has developed Microline instruments which include every type of device essential to precise measurement in the entire microwave field. Research and development are continuous at Sperry and the results are always available to you.

put power, or Class B amplifier circuits.

• **Silicon diodes.** Last fall, Bell Labs announced the development of a silicon diode with a built-in forward resistance ratio approximately 1,000 times higher than for existing germanium diodes, able to operate a 200C transistor. More recently, Avco Research & Development Co. (Hingham, Mass.) announced a new production silicon diode, making it possibly the world's first mass-produced General Electric is reported to be well advanced in its silicon diode development.

SILICON SEMICONDUCTORS, such as the Bell Telephone Labs diode, have high-temperature capabilities previous germanium semiconductors lacked. This will permit air-borne systems not previously possible.

- **Transistors (photocon).** General Electric recently announced a p-n junction transistor photocon which is extremely sensitive, particularly to infrared radiation, making it attractive for use in cameras designed to seek out heat-seeking targets. Output from such system could provide a huge amount to operate a video directly, without video, data amplification, etc. etc.
- **Transistors Two By Two.** Although transistor size small, compared to their vacuum tube counterparts, the germanium or silicon pellet which forms the heart of the device is only a few percent of the total volume occupied by a power of day transistor. The leads, base, support, and other paraphernalia add up to several times the volume of the transistor element itself.

In dual-pulse wave communication, a large number of extremely low-level films are needed, and transistor make attractive active-element film.

Digital computers and devices require vast arrays of transistor flip-flops and diodes. For some contemplated airborne equipment, size and weight will be prohibitive, even if completely transistorized with present air units.

• **Microscopic Connections.** That's why AFRC has set up a microtechnique group to study and promote the development of radically new processes for creating large arrays of transistors and diodes, and their necessary interconnections by depositing various layers of germanium (and, important, on a small postage stamp size card which has more than 100,000 connections) conductors arranged on it. AFRC hopes eventually to construct a 1,500-element transistor diode matrix in a volume of 0.5 cu. in.

AFRC is sponsoring research programs at Rutgers and the Mallon Memorial Research Institute, aimed at new microtechnique basic techniques for fabricating in "growing" all types of electronic components and circuits. Speaking before the Radio Technical Committee for Aeronautics, Dr. W. R. G. Baker, GRI's vice president in charge of its electronic division, said: "It can be possible, in effect, to give capacitors, resistors, as well as transistors into a single crystal."

It is reasonable to assume that Baker's own division is investigating this possibility and that some repeat all progress could come within the next year.

By focusing attention on the new field of semiconductor, the transistor has opened up vast new areas for exploration.

It is not thought unreasonable that a complete semiconductor amplifier or flying stage could be grown, no longer this principle, transistor pellets. Thus, when it comes, will complete the revolution in electronic conducting techniques which is already under way.

Automation

Until recently, electronic equipment fabrication seemed to defy automation. A typical requirement consisted of hundreds of different-sized and -shaped components, laid out in a functional, but hodge-podge manner, with a lot's sort of interconnecting wires.

Among military equipment, electronics had the highest percentage of hand labor, except possibly for some precision instruments. This fact, when viewed in the light of rapidly increasing military use of electronic gear, was clearly one of the major reasons for the need to automate the process of military electronics production.

After the war, Battelle's Supergate Electronics Ltd. constructed a machine which could turn out 500,000 two-hole relay chassis a year automatically—eight for every installation of the machine, plus transformer and tubes. Needing a production run of 25-100,000 units to justify its construction and tooling cost, no mass machines were built after the war. Army studies have since been made by the Army Center for Automation.

• **Printed Circuitry.** In this country, the military services and industry moved away completely after the war.

The Signal Corps and other agencies the technique of using printed circuitry and dip-soldering. Most of the interconnecting wires were etched in printed on a flat board, apparently heated holes were drilled or punched, and component leads were inserted by hand in these holes, and the entire assembly dipped in a solder bath to secure and connect the components.

Today the technique is a widely used technique in medium or large production runs of both civilian and military equipment.

About two years ago, the Signal Corps contacted a GE GRI in developing a machine which could automatically place conventional components in printed circuit boards, using under a direction from a magnetic tape or punch card. This program is expected to eliminate the major remaining hand operation. GE is also developing automated machines to test components out and from their leads, and transport them to the component placement machine. This program, first reported in *Aviation Week* (Nov. 17, 1952, p. 36), is slated for completion by mid-1955.

Meanwhile the Air Force had launched a study development contract for automation of aircraft equipment construction at the Stanford Research Institute.

• **New Bookshelves.** Very little had been heard from the Navy until last fall when the Bureau of Aeronautics dropped a bombshell by announcing

NAVY'S PROTOTYPE PLANT turns out variety of small printed circuit boards completely automatically. The machine uses punch card control system on an electronic control unit.

NEW HORIZONS IN ENGINEERING

What has this symbol to do with

the future of power?

Flexity. You'll recognize this symbol as a conventional thermodynamic cycle. But there's nothing conventional in the new developments in thermodynamics at I-T-E. These revolutionary developments may well usher in new horizons in the field of power generation.

Development work in thermodynamics is only one of the many projects on which the Special Products Division of I-T-E is engaged. Other challenging programs include development of and fabrication of a number of close tolerance devices for aerospace service conditions.

Whether your problem is new development in performance specifications, or fabrication with new and hard-to-work alloys, you'll want to know how this unique organization can help you.

Progress through Problem Solutions

that the National Bureau of Standards had developed an automatic factory for producing electronic equipment and it was in pilot plant operation. The code name for the operation was "Project Tinkertoy" (naturally given the unruly disposition of "Modular Design of Electronics" and "Modular Production of Electronics").

Within several weeks, more than 1000 representatives from every electronic equipment and component manufacturer of consequence had poured in to the "Tinkertoy" Mess, just outside of Washington.

Industry learned that instead of trying to automate conventional electronic components and construction techniques, NBS had developed new components and techniques specially used to automate (Automation Week Sept. 18, 1993, p. 17, Oct. 12, 1993, p. 72).

COMPARISON of New automated assembly with conventional techniques, right, and new "Project Tinkertoy" MDA, shows how new process eliminates labor "hot spot" of interconnecting wiring.

ing electronic equipment up to 44%, including automation of the plant over a 10-year period.

• **Flexibility.** Tinkertoy plant can be changed over in a matter of several days to produce a variety of modules for different types of equipment. This is particularly attractive for converting a consumer goods plant to military production in no time.

• **Easy expansion.** Tinkertoy plant production can be quickly and easily expanded in an emergency by adding shifts, operating seven days a week, without need for training new personnel.

• **More uniform quality.** Elimination of manual operation and use of 100% inspection during manufacturing cycle should produce more uniform, better quality product. Very few defects (one of two of the percent-plus-minus rate chance not suffering more than 75% defect) can be seen currently being accepted.

• **Scale.** Downscale—There are some limitations to the new process. For instance:

• **Expensive for small runs.** Initial tooling and setup costs of a Tinkertoy mechanism make it best for high production runs, not small quantities of several hundred or a thousand, with frequent design changes during the run. The Sigal Corp/G2 machine, which can be converted simply by changing tapes or cards, may be better adapted, more economical for small runs. However, recent cost analysis indicates that Tinkertoy's modular construction, made with lead pipe, can be employed for small runs and often almost as much economy as a conventional factory line.

• **Limited capability.** Large size capacities, high-power resistors, induction and certain other components may not be made by Tinkertoy machines, at

best for NBS is working to expand the range of values which can be obtained, but main concern here that it will always be necessary to use some conventional components. Missing small and automatic operations require some of the advantages gained by using Tinkertoy.

• **Resistive substitution.** Present Tinkertoy module size and weight compares favorably with conventional manufactured construction, but a larger and heavier than conventional substitution construction. Some observers have the opinion that the obsolescence of Tinkertoy may limit further size and weight reduction.

• **Industry interest—Washington Electronic Corp.** is reported to be considering setting up a Tinkertoy plant, with the view to using its output both for military and consumer products.

There is much to believe that American Card & Board, which recently set up an electronic division in Alexandria, Va. (near the pilot plant), has similar ideas. This new division is headed by J. G. Reid, Jr. and R. L. Sherry, long associated with the NBS Tinkertoy project.

The Navy reports inquiries from companies in Canada, Britain, France, Switzerland, The Netherlands, India, and Japan.

These developments, which could upset the traditional balance between component and equipment manufacturers, are being carefully watched. If an equipment maker sets up a Tinkertoy plant, he will spend forces he is familiar with the component people. If the latter should set up a plant, as several are reportedly considering, it would reverse the component manufacturer's share of the pie.

One possibility is the future of the specific modular-type construction and mechanism which NBS-NBS have developed. Project Tinkertoy has sharply pulled industry with the realization that construction of electronic is no longer "around the corner."

• **Advancing the Art—Electronics,** a fast-moving sector in its own right, gets a big hit in the run when it joins hands with the military, and particularly with military aviation.

The continuing search for weapons capability in a space-age, hydrogen-bomb age has produced a condition in which military aviation is the biggest single force behind research in electronic technology and manufacturing know-how.

Industry and research laboratories engaged in aviation work are the vanguard of the march, it is assumed, toward freedom of radar, computer, space mechanisms, and communications knowledge are extracting most rapidly. From the knowledge will come the civilian and industrial products of the next and succeeding decades.

BUSINESS METHODS AND IDEAS

New Ways To Simplify Personnel Work

Mean More Efficient Administration... Tighter Control Over All Personnel... Reference Time Cut To Seconds!

One company now finds it takes only a few seconds to find needed facts about any one of its 1000 employees! What's more all pertinent information is visibly simplified so that even such things as grade-pay increases are handled automatically by clerks.

... then relieving plant supervisors of the necessity of keeping and watching records... and assuring greater accuracy with much less clerical effort.

Presently, the personnel record for each employee of this company (Union Bag and Paper Corporation) consisted of an ordinary file folder into which papers were placed. In the event of a job change, rate change, credit or other reference, contents of the folder were fed through until the proper sheet was found... and more often than not the contents completely misarranged.

Charlton Personnel Folder compared with Rolab-Kardex, one on each side at opposite ends, but all papers in position.

Let us show you how all this was changed so easily by the use of sturdy Charlton Personnel Folders fitted with space-saving patented

Komplet fasteners... which securely lock an employee's various groups of papers to the pages of this book-like folder... preventing accidental loss of a paper or disarrangement... even if the folder should be dropped.

Pertinent Information Visibly Signalled

Even more important, let us show you how easily and quickly all essentials of a paper are posted to the Rolab-Kardex's specially slotted record, before it ever goes into the personnel folder. Hence, the Rolab-Kardex at all times reflects at a glance, a complete picture of what is in the file. Condensed personnel data from the application and a complete, active service record is constantly at finger tip, for instantaneous reference and use.

Fire Protected Equipment

All personnel folders at Union Bag & Paper Corporation are housed in Remington-Rand certified insulated Safe-Files, and all Rolab-Kardex personnel records are housed in certified insulated Rolab-Kardex. This equipment assures protection from the ravages of fire. Let us show you why more companies everywhere are depending such personnel papers, and are turning to certified insulated equipment for personnel records.

Get the full story, "How Remington-Rand Systems Simplified Personnel Records at the Union Bag & Paper Corp. at Savannah, Ga." Circle 629A.

New High-Speed Calculator is key protected and suitable for producing more timely reports and reducing man hours.

New High-Speed Machines

Accelerate and Simplify Production and Cost Records

The High-Speed Calculator with negative check on both registers, the Electronic Sorter with a speed of 800 cards per minute, and the 40 program, 150 card-per-minute Electronic Calculator, make possible the preparation of payroll, production, cost and inventory records at speeds previously unattainable. For descriptions of the speed and flexibility these machines can bring to your accounting procedures, circle TM336, TM342 and TM387.

Rolab-Kardex Parts Control Boosts Record-Keeping Production 30%

Steven Rolab-Kardex users control the recovery of more than 35,000 separate parts at Canamex Engine Co. Rolab-Kardex users up to 30% in posting time. At La Salle, an engineering plant, employee turnover. Get valuable cost history, "How Rolab-Kardex Parts Control Saves Time and Money for the Canamex Engine Company, Inc. of Columbus, Indiana." 10 reasons for using SKYDROL

fire-resistant hydraulic fluid

Actual Extracts From Official Accident Reports Show How Hazardous Flammable Hydraulic Fluids Can Be

- 1 Landing gear suddenly retracted on take-off run. Plane skidded 2450 feet. Fire started in No. 3 nacelle, was extinguished soon, broke out again. Second wheel not fire set permanently. Fire was caused by the injection of hydraulic fluid escaping through a hole worn in the strut by friction on the runway. Fire was limited by friction heat. Fire was subsequently fed by hydraulic fluid escaping from broken brake lines on the right strut.
- 2 Failure of main bearing of cabin supercharger drive shaft dislocated shaft and in some E. which broke hydraulic pump case drain line. The freed hydraulic fluid was ignited by the hot turbine parts.
- 3 Exhaust stack came off and exhaust burned through cow flap, actuating hydraulic line and setting fire to spirals in fluid.
- 4 Generator lead through strut in spine headboard short-circuited in flight and set fire to hydraulic-oil-cooled main insulation. Cabin filled with smoke, making landing extremely difficult. Crash and crash fire resulted.
- 5 Failure of supercharger drive-shaft bearing allowed turbine to slide to back through housing and cut hydraulic line directly below it. Fire limited on hot friction-heated metal. Mainline burned loose and fell from airplane within 8 minutes.

- 6 Evidence indicates that the engine cool flap hydraulic line failed when the flaps were opened for landing and that escaping fluid was ignited by engine turbulence or drag contact with the hot exhaust manifold. Fire was extinguished by ground fire-fighting equipment.
- 7 Cargo airplane. Pilot completed landing, opened main flaps and while taxiing, noticed that right engine was on fire. Hydraulic line to the cool flap cylinder failed.
- 8 Ground fire. Failure of firewall hydraulic line released hydraulic fluid when cool flaps were operated.
- 9 Ground fire. Fire started in right nacelle during take-up, apparently caused by cool flap hydraulic line ground failure which contributed to failure of line. Ignition believed caused by exhaust manifold.
- 10 Ground fire. Excessive wear of brake friction-plate allowed the hydraulic pressure hose to release hydraulic fluid on the brake drum which was hot from several successive landings. Drums were hot enough to ignite the hydraulic fluid.

RADAR TRAFFIC CONTROL, using surveillance radar like this General Electric ASR-1, and voice-plus language military codes, has greatly improved traffic flow around major airports. It seems now as though to enable Air Route Traffic Control Centers to use extremely long-range military code meaning codes, even greater strides can be made.

The Outlook for Civil Avionics

'New' ANDB May Be Key to Progress

Controversy still slows adoption of ultimate civil-military navigation system, but revitalized Board now has increased power and authority to act.

Avionic developments and events in civil aviation during the past year present a mixed scene of progress, controversy and disagreement. The recent reorganization and revitalization of the Air Navigation Development Board gives reason to hope that the controversy will be resolved and that a positive, well-planned program of development will result.

The past year seen:

- **Continues over whether Civil Aeronautics Administration should convert its present civil DME (distance measuring equipment) to a newer military version, called Tacan.**
- **Accelerated activity in the development of an automatic weather radar, spurred by companies and contracting firms on the best operating frequency for such a device.**
- **Encouraging results from the use of surveillance radar and peripheral VORTACs to speed air traffic flow.**
- **Slow progress in solving other traffic control problems.**
- **Speech action in adopting a new automatic landing system, called Selsol, designed to ease the pilot's radio monitoring duties.**
- **Reorganization of the Air Navigation Development Board, giving it increased authority and power, to make present DME contractors, prevent future problems of this nature, and open the development of the ultimate precision civil-military navigation system.**

- **Uncertain and Slow—Compared to some of the rapid military avionic developments, civil progress seems uneven, slow. In part, this is inherent in the nature of things.**

Who really gets the lion's share of development funds, with civil getting the little scraps. The military must and does much work for field technological advances, a risk which the CAA cannot afford. New civil navigation and communication equipments, some which widespread use seems slow, and only when military business, and private firms can justify their continuance.

There is another reason. The ANDB program which should have provided more advanced common system developments was badly hurt several years ago.

Disagreement within the ANDB resulted in the withdrawal of effective support by the military, who pulled out many important projects for exclusively military development. With vanishing funds, and little authority, ANDB has had to keep along.

CIVIL DME equipment is in production by Norel and Bendix/Radiation despite the uncertainty regarding the program.

AUTOMATIC flight plan processor, designed to store up to 1,000 flight plans on a magnetic memory drum, search for possible conflict and provide instructions on separating aircraft to Air Route Traffic Control Centers, is under collection by CAA.

you can DEPEND ON ZEP OXYGEN EQUIPMENT

AVIONICS

SELCAM, one selective calling system which enables active ground stations to hear individual aircraft when it wants to talk to them, has grounded noise interest.

► **Weather DME:** The recent civil aviation DME response is another direct result of the previous unscheduled failure within ANDR, and is its under implication, the cause of the original backup. Since that time, the military has proceeded independently with the development of its tactical navigation system (TANS), along the "Ultimate Common System" has recommended by Special Committee 31 of the Radio Technical Committee for Associations. Meanwhile, CAA has proceeded with implementation of the "Intercom Common System," using VORs and DMEs recommended by RTCA's Special Committee 49. A recent CAA viewpoint is that it is unable to complete implementation of all planned VORs and DMEs this year.

The military plans to use TANS for aircraft operating in the U.S., and is concerned over possible interference between it and civil DME in some locations. Both are pulse-code systems operating in the 1,000-900 band. The civil system uses 50 sec of the band, with 25 sec channel spacing, and pulse-coding (multiplexing) to provide 100 individual interrogate and reply channels. TANS requires 250 sec, with 1 sec channel spacing, narrow pulse-coding for transmitting station bearing and other information.

► **The Military Problem:** The military, operating under a complex military administration, is confronted with two replacement alternatives in addition to the interference problem. These are: 1) Set up a TANS network which eventually duplicates existing federal services and provide necessary operating and maintenance personnel at a cost estimated at \$50 million.

► **Equip military aircraft with both civil and military navigation gear,** to

enable them to operate in the U.S., yet fly overseas and operate in a tactical area on a moment's notice. This means added equipment costs, and more important as jam-packed fighters and interceptors added weight and space is quadrupled.

That explains why the military now wants CAA to modify its present civil DME ground stations to TANS system. If this were done, military aircraft would share both distance and station bearing signals from CAA TANS DMEs, while civil aircraft would get only distance information. Civil aircraft would continue to use present VORs to obtain bearing information.

► **CAA Still Tug-**So far, CAA has refused to budge, pointing out that it has already purchased 450 ground stations, all installed at this site, and that of them in operation. CAA, and civil DME supporters, see that a change would:

- **Delay civil DME** use by three to four years, requiring extensive modification of present ground stations, development of new civil airborne units. (Both Navco and Honeywell/Rendac are now in production as civil airborne DMEs).
- **Increase cost of airborne units** for civil aircraft because of closer channel spacing and added design sophistication at TANS, a serious objection for private and business aircraft operators.
- **Abandon power system** for one which is still far from operational (Aviation Week requires to qualified people produce differing opinions as to whether TANS is generally "V-shaped," in indication that some problem may still exist).
- **TANS's Civil Advantage:** TANS supporters counter these arguments by pointing out that it has potential for growth into the ultimate common sys-

tem blueprint several years ago by RTCA's Special Committee 31. By adding small adapters to a civil TANS DME, at some later date before their purchase are discarded, a simple idea how could provide distance, station bearing, transponder (aircraft) beacon, and possibly even private use ground-to-air communications, they say.

The opposite acknowledges that some of the techniques used in TANS may find application in the ultimate common system but says that the future system should not be handicapped by TANS's limitations. (For a more detailed presentation of the pros and cons, see Aviation Week Dec. 7, 1955, p. 40.)

One of the first tasks of the proposed ANDR is to evaluate TANS for "possible later application in the common system," according to the official Commerce Dept release. Observers expect the new ANDR to attempt to make the present military-civil DME appear at the next time.

► **Weather Radar:** Three-day contract with DME, the active weather radar program looks more encouraging. After more than a year of study, investigation and experimental flight test to establish requirements, development of active radar for storm warning and in viewing ahead full speed. The program is accelerated by technical disagreement over whether the older X-band (3.2 cm) or newer C-band (5.7 cm) is best for active use.

Two manufacturers are currently in the race.

► **Radar Cap:** American expects to fly a C-band prototype within 14 months, to be in production within two years.

► **Brady Radar:** It is said by a prototype X-band set in a few months, hopes to be in production within a year.

Aero's Aviation Electronics Engineering Committee recently completed its winter radar characteristics (spec) which calls for operation in C-band. AEREC's choice is based on the radar's primary intended use as storm avoidance and the accepted fact that C-band energy yields air information than X-band in heavy rainfall. A limited study by Dr. J. S. Marshall and Walter Hitchcock, weather-radar experts at McGill University, indicates that C-band has considerably greater stage of penetration through heavy rainfall.

Until Air Force has concluded that C-band radar is the optimum for airborne weather mapping purposes, on the strength of its analysis of last summer's tests on an experimental RCA C-band set. However, except for the informal and inconclusive test with a Navy RSD, there was no direct X-band versus C-band comparison.

► **Pros and Cons:** Opponents of X-band say that its shortcomings will show up

ALL DOOR and 352 yards WIDE

engineered and built for
LOCKHEED AIRCRAFT CORP.
Garden City, New York

by **INTERNATIONAL STEEL**

in co-operation with
KORRETT & CO. Associates,
Atlanta, Ga. Architects & Engineers
WAGNER BROS. CONSTRUCTION CO.,
Montgomery, Ala. Contractor

You have to put up a BIG door for a flight hangar like the above — part of the massive Government Aircraft Plant No. 6, where Lockheed is producing Boeing-designed B-70's for the Air Force. And you have to fill that BIG air wide door, to provide an entrance large enough for these giant Air Force jets.

International was Lockheed's chosen choice to handle the tremendous job. In essence, it duplicated other larger entrances designed and built by International. Much of the basic planning of these record-breaking projects was done with the help of International's design engineers.

Lockheed's own needs were for 16 door sections — each 64 feet wide by 64 feet high — divided equally to form a dual-opening entrance. Each section operates singly — as one and all can be opened or closed concurrently. This adds up to two complete entrances each 128 feet wide — a total of 352 yards of recorded door.

This same experienced help can be put to work on your door problems . . . and on any problem involving steel fabrication . . . by calling on International. Mail coupon today for our complete catalog of the standard and Aviation Division.

**Gear
Assemblies
do more
jobs better**

Provision is the watchword in aircraft engineering and it is the major factor of every advance Gear Assembly. No matter what the specifications may call for, someone is qualified to meet them with precision gear assemblies that give perfect performance under the toughest conditions. Advance engineers and craftsmen combine many years of experience with the most modern equipment to produce gear assemblies that meet your speed requirements. Illustrated below are a few of the many different assignments that we have completed for the aircraft industry.

1. An integral part of the mechanism of a 40 HP turbine driven unit installed on a McDonnell Aircraft Company.

2. This elevator drive unit from a Boeing aircraft is part of the main drive unit of a Boeing 747-400.

3. Helicopter gearboxes use Advance facilities to produce gear assemblies with the highest gear box.

■ AVIONICS

which in aircraft must operate a front container, heavy control. X-band at 10 cm or less will give a false picture of storm depth, reduce the effectiveness of weather radar, and type radar display intended to show pilot pilots of low turbulence, their use.

To this, X-band supports point out that C-band radar beams are almost twice as wide as X-band. For the same reason, it will therefore be unable to see narrow, non-flooded paths between storm cells. They also point out that pilots will be in for completely around storms, wherever possible. Through clear air or light rain, X-band is able to spot storms at a greater distance than is the case with C-band. (For full discussion, see *Aviation Week*, Feb. 22, p. 32.)

Other factors—X-band radar is generally given a small edge from the standpoint of weight and size because C-band wavelengths and frequencies are even slightly larger. X-band probably will have a price edge because RCA must develop a new C-band receiver, although the company hopes to liquidate development costs over a long period and several other possible applications.

However, C-band systems may be seen, recognition will be conservatively designed to achieve substantial gains, an advantage over an X-band tube developed for military use, where every ounce of performance is required.

Active Interest—Among the larger concerns, there appears to be considerable interest in weather radar. Plans for installing a new AN/APR-46 (X-band) set in a DC-8B expects to be the first in its radar in regular operation, may be the first to equip its fleet, probably, with Bendix radar. Used in close behind might come order for its DC-7B. Packard is planning to test the Bendix prototype (X-band) set this summer. Bendix currently has two APR-46s on loan from the Navy, is scheduled to install one on the aircraft. TWA and National are also interested.

An active series of studies last spring indicated that practically all of the operations either wanted more installed, or provision for installation in their future, two-engine aircraft. However, it is not clear if the future two-engine aircraft were wanted with radar or without any provision.

Speedy Action—There is much to do, that airlines and the aircraft industry can move fast to make use of a new technological development for an operational need. The evidence is a new selective calling system called "Select". Select permits an inflight ground radio station to find a light or ring a buzzer in the cockpit of an individual plane to which it wants to talk, and

when the pilot of a continuously monitoring his radio receiver for possible incoming calls. (*Aviation Week*, Nov. 16, 1959, p. 71).

The American World Around Pacific Airline (AWA) suggested the problem, adopted an industrial calling system (developed by Motorola) for a service unit and tried it out. Select proved to be successful, that AWA decided other airlines might be interested. Operating through AWA's AETC, an industry-wide system characteristic was proposed.

Two manufacturers, Motorola and Bendix Radio, quickly designed airborne and ground equipment for use. Motorola is already in pilot production, Bendix expects to follow shortly.

In addition to finding application in emergency cases, Select also will be useful in domestic operations where pilots are spending more time monitoring Air Route Traffic Control Center (ARTCC) channels, making it more difficult for them to respond quickly to requests from their own ATIS channels.

Fewer Delays—Air traffic now flows faster, with fewer delays in IFR (instrument) weather, makes more frequent landings and departures at and from high density airports. This is the result of increasing use of satellite radar and direct communications between Air Route Traffic Control centers and the aircraft operating under their supervision.

At Washington National—Radio traffic control, powered at Chicago Municipal Airport and CAA's Technical Development Evaluation Center in Indianapolis, has been most fully implemented at Washington National Airport. (*Aviation Week*, Mar. 16, 1959, p. 14). A Washington military radar given the Washington ARTCC center units of all aircraft up to 100 miles away, extending the normal 30-mile range of the control tower ASR-1.

With order right, ARTCC can handle inbound, and active radar outboard, traffic with overall separation reduced from 15 to 10 miles. Inbound traffic is led to land using approach gates (for radar, or compass location) where control tower operators, using their ASR-1, take over.

Bellows & Bellows—During the first year of full radar control, Washington was able to:

- Double airport capacity during IFR weather.
- Cut traffic delays. Total delay time during three-hour winter peak was cut about 51 over corresponding in several previous years.
- Virtually eliminate stacking.

With increased operational know-how gained from experience, there has been further improvement in the winter cut loss. A composite of total ap-

PNEUMATIC COMPRESSORS

CORNELIUS COMPRESSOR
A CHANCE VOUGHT
HYDRAULIC MOTOR DRIVE

FOR NAVY CUTLASS

Chance Vought Aircraft uses Cornelius air compressors on the F4U-1 Cutlass, superior Navy monoplane. In specifying Cornelius compressors, Chance Vought recognized the need for a compressor that would perform well at high altitudes, temperatures and humidity.

These Exclusive Design Features Show Why Cornelius Air Compressors Run Cooler Than Any Other Compressor

1. Heat of compression dissipated over six cylinders.
2. Cooling fin is 8 inches in diameter with 14 inch pitch.
3. Cooling fin area is 5000 sq. in.
4. The six cylinders have a total fin cooling area of approximately 9500 sq. in.
5. Inside valves are located in sides of cylinders—not in top cylinder heads.
6. Flared cylinders are made of aluminum so provide for more rapid heat transfer.
7. Hotter generating piston rings are not used.

If you have a requirement for a compressor to operate under high temperature and altitude conditions, please permit us to furnish additional information regarding our units. We will also gladly supply compressors on consignment, on qualified terms, for test and evaluation.

MINNEAPOLIS 21, MINNESOTA

PIONEERS IN THE DEVELOPMENT OF AIRCRAFT PNEUMATIC SYSTEMS

Computing machines have created one of the fabulous chapters in the history of American industry. A few enterprising men in each generation have been unwilling to tolerate mediocre tools and methods. They are the physicians, engineers and designers who today are meeting the requirements of our changing world. At Melrose

we are testing new materials and seeking new techniques to meet constantly higher standards. Dissatisfaction with what has been done, plus the determination to improve, is one of America's greatest assets. This attitude is a guiding policy at Meltron.

Present thinking is that teletypes will be used to feed flight plans or weather data to the machine, special display boards or teleprinters will be used to obtain information from it. The application of the machine involves both operational and technical problems which TDEC must work out.

Indonesian Center—New traffic control aids and procedures will get their evaluation in an actual operational environment after this summer, when the Command ARCC center moves to the Indonesian West Coast Airport to become part of the new Aeronautical Information Center (AICC) being established.

ADSC plans to explore several techniques for operating remote control valves, piping flow patterns into an ARIC motor. Techniques will include microwave relay, broadband cable circuit, slowed down video to permit use of narrow band telephonic links.

ADSC also intends to evaluate several techniques for identifying individual aircraft on radar scopes, including use of radar (aircraft) beacons, ground direction finders, position fixes that are established by means of airborne VOR/DME.

• **Human Engineered Centers**—Another important objective of the AORC program is a more efficient ARVC center design, including better communication and handling procedures, with adequate attention to examples of human engineering. Bell Telephone Laboratories are under contract to develop improved interphone systems, air-to-ground communications consoles, floor plan layouts and accessories.

To evaluate suggested improvements and new techniques, AOEC will have dual ARTC facilities within a single room. On one side will be the regular operational center, always ready to perform required duties. The other side will be an experimental center in which new ideas are incorporated. When these are ready for evaluation, one or more of the ARTC controllers will shift their chairs to the other side of the room.

If new devices prove unsatisfactory, the controller can instantly return to the regular meter. If they prove desirable, the improvements will be incorporated in the regular meter.

► **Progress Slow**—Despite ambitious plans, progress is spotty. For instance,

LIGHTWEIGHT, THINWALL

heat exchangers

AIR TO AIR
AIR TO LIQUID • LIQUID TO LIQUID

Stainless Steel or Aluminum to meet your specific design needs!

To meet the challenge of higher temperatures in advanced jet engines, South Wind has developed new lightweight, thermal stainless steel heat exchangers. These heat exchangers fully comply with the rigid specifications set up by engine and engine manufacturers, as well as the makers of jet engine cooling packages.

In addition to stainless steel, thinwall aluminum heat exchangers also are being designed and fabricated at South Wind for many different applications: Heat transfer from air to air, liquid to liquid, and air to liquid is being achieved effectively with the new South Wind heat exchangers, which utilize either the tube bundle or the plate and fin types of design...which ever the job requires.

For Aircraft Heating or Cooling—Flitters in the field of aircraft heat exchange equipment for providing heat, South Wind has now put their experience to work in the development of heat exchangers for cooling purposes...another service to the aircraft industry.

Whether you need to heat transfer equipment, South Wind's experienced engineering staff will be glad to consult with you. For information, write Stewart-Warner Corporation, South Wind Division, 1214 Greiner Street, Indianapolis 7, Indiana.

aspart surface radar (ASDR) was an early pattern developer, and a modified version was tested for several months in 1952-53 at N. Y. (later at the ASDR). Yet as improved equipment (its effect by itself) new under design will not be available to AECU until 1958-59, an ASDR system situation.

The important airborne radar horizon development program, intended to provide positive means of identifying results on ground radar stages, has suffered many delays and false starts. Last summer the program was launched on the basis of L-band (1,800 mc) operation with integration by special (technology) ground radar. But the program is once again up in the air because the military has indicated that a new class of frequency may be necessary.

There are many explanations for this slow pace, but an important one is the lack of a strong ASDR program with full civil and military support and adequate funds. For several years, military research development funds have run almost 100 times those of the CMA ASDR. In the post-Korean period, when demand for sophisticated aviation industry facilities and manpower, the military has had top priority, if only by virtue of its funds.

► Eyes on ASDR—The aviation industry has its eyes focused on the newly organized ASDR in use whether it is a top-level research or a development project which sponsored the previous group. They first task is to resolve the civil and military issues, about as tough a problem as they could have found.

ASDR's success in solving this and other difficult problems, and in laying out a language "transmission system" developed program during the coming months will determine whether to have a navigation system which meets the needs of the next decade, and whether it is a "common" civil-military system or a separate one or is better.

► Military Divided—Many of the military aviation developments now under study seem well in hand to be declared for civil use. At least much of the technical know-how will find civil applications. Texas and digital communications are two examples.

Civil aviation will benefit from new-type construction techniques which will permit more use and weight reductions for growing numbers of aviation equipment which have been encroaching on airframe payload. In lightplanes this subminiature construction will permit better altimeter instrumentation without excess component weight.

There are some of the worldwide impact aviation which civil aviation can expect from the future which go into military aviation development.

the pilot's unseen helping hand—

AEROTEC AUTOMATIC CONTROLS

The singularity of present high speed military aircraft has diminished the pilot's manual ability to control all aspects of his flight. At speeds over 3000 feet per second, a pilot must concentrate on his trajectory. Such functions as fuel transfer, tank-pressure regulation, afterburner eye-id control, cabin pressurization and fuel-flow damping must be accomplished automatically. In these functions, AEROTEC Float Switches, Valves and Pressure Switches have contributed greatly to the solution of flight problems at trans-sonic speeds—truly a pilot's unseen helping hand!

AEROTEC Automatic Controls have passed extensive qualification tests simulating actual flight conditions in accordance with Spec MIL-E-3272. They are installed on such high speed aircraft as the Boeing B707 and B62, Grumman F1F-4, Northrop F8D and Lockheed F94G.

Constant research by AEROTEC Engineers late problems of automatic fueling, high-pressure activation, corrosion and high- and low-temperature conditions has maintained AEROTEC's reputation as progressive designers and manufacturers of the highest quality products.

Let our qualified engineering staff help solve your automatic control problems. One of our specialists is near, ready to serve you. Call or write today.

When you think of Automatic Aircraft Controls, you should automatically think of AEROTEC.

Business Flying

Multi-Million Market Goes Begging for Takers

Business flying, still riding the crest of its phenomenal postwar boom, is expected to gain even wider acceptance during 1954 as more companies take to the air in their own planes.

Lifting of the excise/profit tax in January was interpreted in some pessimistic quarters as the turning point where world war companies taking inventory of the high cost of operating aircraft with a view to eliminating this "taxen" item from their budgets.

Here to stay—But the trend seems to be exactly the reverse, as more U. S.

business firms accept the premise that convenience and time saved in flying high-speed executives more than can offset the cost of aircraft operation. Stockholders, heretofore the most inclined to rebel over airplane expenditures, seem to be taking a more liberal view and are becoming increasingly unopposed to this thinking.

Since all of the present indications, it would appear that business flying is here to stay.

► **Growing Pains**—Certain basic problems must be solved, however. Business flying is currently going through a series of "growing pains" that must be treated carefully if the field is ever to mature as fully potential in an integral part of U. S. industry.

Right now, it's going through what might be called the "infancy" stage, being reached the maturity of a full-grown segment of aviation but still seeking for organizational and technical advances to catch up with it.

► **Major Problems**—Some of the chief problems:

► **Lack of adequate equipment.** Present owners for the most part are not satisfied with their aircraft. Unless they are using obsolete transport models, converted World War II bombers, or, as a compromise, they are operating later models that are not particularly suited for their purposes.

CESNA 310

These planes are far outmoded designs in their own right, but the majority of flying executives holds either capacity or performance as the two most vital of the requirements for a business aircraft.

► **Lack of basic information.** Companies operating business planes, and those contemplating such operation, are in desperate need of a common standard whereby they can obtain basic information on the field and also exchange ideas on operating procedures to mutual advantage.

► **Lack of market data.** Manufacturers, dealers of producing equipment for the business flying market, find that there is an acute lack of information upon which to base specifications for such equipment.

A plane designed specifically for one job may, for example, in the domain of most business flying equipment. Operators want such a plane built, and manufacturers would very much like to produce it.

But in the absence of a common medium through which companies can get together, define what they want in the way of specifications and present unified proposals to the manufacturers a complete stalemate exists.

Before manufacturers will go into production of a plane specifically designed for business use, they must have an estimate of the size of both the actual and potential markets. Also, they want something in the way of a cash guarantee to help finance production costs.

► **Chasing a Goose**—Some feel that in the absence of a unified proposal by the operators the only means now to be in the way of an intensive market approach program by the manufacturers themselves.

Two things seem certain: ► **Until definite specifications are set up, the multi-engine business fleet will continue to be made up of obsolete biplanes and "compromise" aircraft.**

► **In order to ascertain both specific needs and size of the market, mutual co-operation is needed between operators and manufacturers.**

Until such a close working, operator-manufacturer relationship is brought into being, it is considered doubtful that any type or types of multi-engine aircraft specifically designed for business flying requirements will ever get beyond the drawing boards.

It would be a shame, when on top, if this were and widely important segment of aviation were allowed to deteriorate before it has a chance to reach its full potential.

But indications are that this could happen if something isn't done soon toward design and production of specific equipment.

► **Can They Compete?**—Companies will probably settle for whatever is available for the next two or three years, but by that time the business fleet, made up of compromise planes, will be in no position to compete with the conventional

TEMCO TWIN-NATION

ing speed and efficiency offered by conventional drives if it cannot offer comparable or even better service.

It would be unrealistic to assume that one plane specifically designed for business flying would satisfy the requirements of all U. S. firms operating in this market. But it would be a step in the right direction. If the specifications are sound, it should satisfy the new market.

Some smaller companies, of course, cannot afford to do just what the type airplane that most of the larger corporations require. For example, a plane capable of 1,000-cu. ft. cargo, 300-mph cruising speed and capacity for 10-12 passengers would probably be suitable for larger corporations, but smaller companies can do with the lesser performance and capacity of models presently on the market.

Emerging Market.—The fact remains, however, that there is an estimated eight-million dollar market among larger corporations for an efficient, high-performance multi-engine business plane—a plane currently not in existence. Thus, the market that must be satisfied if business flying is to continue on a large scale.

The desire of corporations for such an aircraft should not be construed as criticism of all of the planes that make up the present business fleet. Each is considerably capable in the job it was designed to do, but none has the overall characteristics required for a business plane.

Collectively, they come close to meeting all of the requirements, but individually must fall far short of the mark. Some operators are satisfied, for the present, but the more progressive companies are considering the outlook for the future—some to five years from now.

What they want is a 1955 or 1956 design that will be capable of equaling or bettering the entire service of that day.

So far, nothing is in sight.

► **Long-range Bonanza.**—In the meantime, companies operating business planes continue to compile an extensive record with the equipment at hand.

Notable two-engine models in today's business fleet include:

- **Boeing Super 18**, modified, "stamped up" version of the Model 18.
- **Acro Commander**, manufactured by Aero Design & Engineering Co.
- **Black Twin Bonanza**, Model B50.
- **Apache**, Model PA-12, manufactured by Piper Aircraft Corp.
- **Cessna 310**, manufactured by Cessna Aircraft Corp.
- **Lexington**, a stripped-down, souped-up modified version of the Lexington Model 18, converted by Lear, Inc. This 10-passenger plane is reported to have exceeded overall Lockheed performance, reaching 278 mph at 10,000 ft. Some feel that this might be the interim answer for a business plane.
- **Temco Twin-Nation**, two-engine conversion of the single-engine Navajo.

Powerplants, use of accommodations and content of instrumentation vary

ACCURACY • DEPENDABILITY • VERSATILITY

RREP 842-C FM RECEIVER

A double-conversion FM Receiver covering 88 to 215 MHz band which meets the highest standards for quality, and including extensive special circuits to make tuning simple and precise and assure long, dependable operation.

This receiver features an integral part of the RREP Telemetry system, where it is used to receive RREP signals in the 215-255 MHz band with a deviation of ± 125 kHz, and to demodulate these signals for reference to an accuracy, distance, and/or frequency system. May be used similarly in Radio Control systems or as a broadcast receiver accurately, dependable response to 215-255 MHz signals in the 215-255 MHz range is required.

FEATURES

- Superheterodyne 4 conversion or better in space frequency and 4 conversion or better in time frequency
- Signal to noise ratio of 40 dB or less
- Frequency response of 0.1 Hz to 100 kHz
- Frequency response of 0.1 Hz to 100 kHz
- Frequency response of 0.1 Hz to 100 kHz
- Frequency response of 0.1 Hz to 100 kHz
- Frequency response of 0.1 Hz to 100 kHz
- Frequency response of 0.1 Hz to 100 kHz

RAYMOND ROSEN ENGINEERING PRODUCTS, Inc.
32nd & Walnut Streets • Philadelphia 4, Pa.

considerably among these agencies. For example, the French Super 16 is powered with two Pave & Whittaker Anemot R955-AN-14s that deliver 450 shaft hp at 2,300 rpm.

The Turbomeca and Aero-Cosmo engines are both powered with 250 hp power Lycoming engines, the Cosmo has two Continental 240 at 225 hp, and the Pave has two 150 hp Lycomings.

Detailed specifications and performance data are given in the specification section of this issue.

• **CGA Stand-By-Design:** the availability of these over aircraft, the major portion of the two-engine business fleet is made up of the all stand-by.

- **Douglas DC-3**
- **Beechcraft 18**
- **Lockheed Lodestar 18**
- **Remainder of the group is made up largely of scattered, World-War II**
- **Lockheed, such as the Douglas A-26 and B-13, Martin B-26 and North American B-25J. Cessna's Waggon and Malibu, and Lockheed's PV-1**
- **Vietnam would cut the two-engine pattern, with the exception of a few Cessna 240s and 240s used by some of the larger companies.**

• **Single-Engine Aircraft:** The single-engine plane has found widespread application in business flying, except for smaller companies and individual businessmen who fly themselves. Economic operation is the big factor.

And there's an shortage of suitable models, either. Unlike the two-engine aircraft, single-engine planes have a wide variety of models types from which to choose.

Leaders in this field are the four-place Beech Bonanza E15, the Piper Arrow and Tri-Power, and the Cessna 170 and 180 series. Others are heavy for all of these planes, indicating a high degree of construction with present single-engine equipment.

• **Factors and Figures:** Because of the scarcity of reliable statistics on business flying, it is difficult to obtain a cross-section picture of the field as a whole. In total number of aircraft currently in operation, percentage of time, and single-engine planes, number of hours logged, total number of hours flown, etc.

Almost all data currently being collected is put out by the Civil Aeronautics Administration, and, by CAA's own admission, it is far from accurate.

But, in the absence of facts and figures from other sources, it is all the industry has to go on. Every year, CAA compiles a set of statistics on business flying for the previous year. Such information could be invaluable to operators, manufacturers and all other interested parties, but it has these drawbacks:

- It is published anywhere from 12 to

■ BUSINESS FLYING

14 months after close of the year for which data has been compiled (1952 report came out in February 1954).

It is compiled in such a way as to leave some (but a reasonable margin for error and inaccuracy).

• **CAA's Yearbook:** A typical CAA study lists "inactive" as well as active business aircraft. In many cases, these inactive planes have not flown in several years, but because they are still listed in CAA records as business aircraft they are included in the overall total. In the published figures, however, no differentiation is made between inactive and active planes. As a result, the totals can be off by a wide percentage.

Discrepancies are not to be taken in March or April of the year being surveyed, requiring an estimate of the number of hours that will be devoted to business flying during the year. CAA publishes the total of these estimates in the annual "Yearbook of Basic Facts" for that year.

Many planes are used for combination business and pleasure. In its published reports, CAA lists total number of hours flown by these planes under business flying. This same total is included in the section for pleasure flying. No division is made or estimated between the two.

All of these figures require wide distribution. In the absence of more accurate data, they are relied upon by all aviation, general aviation and manufacturers for planning purposes. They constitute the only yardstick currently in existence by which the growth of business flying can be measured.

Possibly, CAA, only increasing its methods in the future. But, for the present, officials say economy and lack of adequate personnel and facilities prevent a more comprehensive study of the situation.

- **Figures for 1952:** Latest CAA study was released last month for business flying in 1952. Here are the figures:
 - **Hours flown were 5,124,000, almost three times the figure for business flying for 1945.**
 - **Miles flown increased 41% over 1951.**
 - **In 1952, general aviation business flying accounted the reverse roles of the individual domestic carrier by some 600,000 hr.**
 - **Total of 30,500 aircraft was engaged in business flying during 1952 (not all exclusively business aircraft).**
 - **Some 11,400 company-owned aircraft engaged in business flying in 1952.**
 - **Individually owned aircraft engaged in business flying numbered 19,100.**

Crucial addition of business aircraft was registered by the petroleum industry, says CAA, with manufacturing and mining industries among others behind.

Is Manual Switching your problem?

KLIXON D-6752 CIRCUIT BREAKERS
Withstand over 10,000 Manual Cycles with Load!

Here's a circuit breaker that gives positive circuit protection every year of operation. This design is the only push-pull, trip-free unit that can be cycled manually several thousand times with or without load without significant change in calibration.

Field reports indicate that many circuit breaker designs which require movement of the bi-metall element for collecting charge calibration even when cycled a few hundred times without load—the D-6752 has a special latching mechanism which prevents this calibration change.

Like all Klinton Circuit Breakers, the D-6752 is individually calibrated and inspected for ultimate trip and high overload tripping, assuring accurate, dependable protection under all light conditions.

Write for specification data which gives complete information.

Military Copter Success Spurs Civil Use

By Irving Stone

Today's copter is far from perfect, but it surely is in business. It is still the product of a relatively young art, but the industry and the public today are more conscious of rotary-wing craft than ever before.

HELE KIDL:1

SIKORSKY HO4S-1

PIASICKI 576-16

Service experience has demonstrated consistently what the craft can do. And the coming era of the copter may usher in a positive collaboration between military and civil users that ever before experienced in conventional modes. This can bring far-reaching benefits to the industry in general by cutting down the problems involved in the transition of a military design to civil application. Anticipating a "bumping" transport era, airline interest in quickening transportation schedules already are in discussion with the major producers of helicopters. This doesn't mean that the present types of copter won't be used as far as long time. They will, but interest is centered not only on existing types but on those in the far-ahead planning stages as well.

Interest in the machine itself isn't the only factor which has been accelerated. Helicopter planning also is underway, with ideas being contributed by manufacturers, operators and interested parties.

"Different Beast"—Too frequently the rotary-wing craft is compared with its fixed-wing counterpart on the basis of cost, speed, range, and cargo- and passenger-carrying capacities—yet it's often realized that the copter is a "different kind of beast."

It has unique characteristics and must be judged on this ground alone. Whether you look at it from the viewpoint of cost or performance, there's a price to pay for the ability to hang in the air, go up or down or forward or backward at will—things the conventional plane can't do.

Big operational dividends over and above the copter's basic characteristics will come as engineering refines the machine. Meanwhile, it is going to take a lot of effort to build into the copter a performance comparable to that of the fixed wing-of-the-over can be achieved.

Korea's Value—Military experience, highlighted particularly by Korea the war operation, although conducted with copters not easily substituting what was wanted, has gone far to define the usefulness of the copter, pointing the way to abilities it is expected to have.

International companies conducting the military have made available study the development and production means to bring out copters embodying accelerated progress.

Civil agencies, particularly those of the local passenger services, even now are showing the way to lesser copter potentials—and opportunities.

Where We Stand

At the present standing, it looks as if copter development will parallel in general aspects, the development history of fixed-wing aircraft.

With the copter's distinct different flying characteristics firmly established and its usefulness emphatically demonstrated, next big battle concerning the designers will be what form the future transport rotary-wing aircraft will take—what will be the "signature" control, what sort of best "standard?"

Growing Up—In this respect, development still has not reached a status comparable to the early fixed-wing transport such as the Douglas DC-3. A glance at a warbook for aircraft of the late 1930s discloses the various configurations of the fixed-wing planes of that era. This, approximately, is the case positive stage in which the copter now finds itself configuration-wise.

Despite the pronounced variations in present-day rotor systems and other rotary-wing details, indications are that the copter definitely is on the path to an aggressive configuration. But there have been the adaptation process apparently still is not sufficient. How soon the degree of information will be achieved depends, in the main, upon the effort expended. Experience for the effort may well be stepped up by increasing airline interest and studies aimed at copters for various route plans.

It is likely that, in the not too far future, the industry will see the better design survive, followed by research and redesign leading to at least two copter configurations generally accepted as standard for large-scale transport use. The recent two types will have to emerge in that there will be two general categories of service—a helicopter or

intensity run and the longer-leg intensity curve.

► **Good Base**—The more demand for rotor development has an excellent base from which to work. Structures are good, rotor head problems in a large measure have been solved, and the aluminum blade, with its excellent characteristics for thermal stretching as an aid to all-weather operations, has carved a place for itself.

More conceptual types than which to draw are coming into the picture. While the turbine appears as a promising contender, it will have to be as attached and tailored to its specific job. Small shafts—Many of the projects already studied up for the rotor probably would have been better if rotary-wing companies had engineering efforts comparable to those found among the large fixed-wing aircraft manufacturers. One of the latter might easily employ 40 or more men for some manufacturing job, but the less of this number, even on a short-term basis, would make a serious dent in the creative output of a relatively small rotary-wing builder.

Some comparatively big problems remain. Some of the more pressing

ones which must be attacked in rotor development involve stability, high-speed rotor, vibration, fatigue, and ground and bearing considerations.

The prospective civil uses of rotors have had their initial thrusting kind by subsidies of what the helicopter can offer in numerous fields of use.

In addition to the fairly established utility category, the immediate future copiers now seems to have boiled down to the transport and executive-type categories. None of the industry members now building copiers consider that the rotor will be the average man's means in the near future.

Executive Copiers

The executive-type copier is expected to make its own market, opening a broad new field in many instances, fixed-wing copiers do not reflect much commensurate over scheduled as transport, whereas the copier will be able to carry the executive from point-to-point in a relatively small, plastic, or even in a helicopter.

Initially, because of cost and maintenance factors, it is likely that executive-type copiers will find application with the big companies, first used by

those which already utilize fixed-wing craft.

► **Utility, Too**—The executive type also will double in the utility category, and ranging from three to eight places will fill a category now in greatest demand in the export market. An example of the magnitude of the export market, 44% of Bell's Model 47 copier commercial sales finds its way into this market.

In the domestic market, even for the executive utility copier looks big. Even now, 54% of Bell's total domestic sales (U. S. Canada and Alaska) are split into these specialized operations—construction (14%), training (10%), medical (8%), local government (8%), military (4%), petroleum (22%), utilities (19%), national governments, or defense of military (10%), overlapping functions (4%), and executive transport (7%). Industry observers see a big expansion in the latter category.

In the production of the small type copier, it is expected to the transport type, Kaman and Cessna probably will emerge as first-line contenders, in addition to those already established in the field.

► **Cessna Commander—Cessna**, now by a four-place rotary-wing craft preparation in certification stage, will gain production this year at present plans go through.

Then four-place is aimed directly at the executive and military markets—the company has no intention of getting into the transport field. Then is considered a smart attitude, for the company is simply adding another product to its existing line. Cessna is one of the companies in the favorable position of having its fixed-wing sales already established. Nothing the copier should be an additional bonus.

Transport Copiers

Building copiers for the transport category, Sikorsky, Pausch and Bell are

HILLER YO-1

going to be the big factor, although some of the more sophisticated of hard-wing aircraft are anticipated in the market prospects. Douglas, for one, has had the rotary copier under consideration for a considerable time and has a design team organized for specific work. Fairchild, too, is said to have a team advance in the field.

► **Sikorsky—Sikorsky's** 10 place S-55, although performing yeoman service for New York Airways, Los Angeles Airways, and others in California, is what is becoming a copier transport aircraft, is considered too small for transport operations now considered.

Sikorsky's S-56, and version of the H-19, the latest copier in order to debut for military (Military Corps) work—scheduled for commercial availability in about two years, subject to Military Corps approval. This is money that was anticipated. It will be offered as a 30 place aircraft, although it would accommodate 35 for short legs. It constitutes an excellent base for future development in the copier transport field. Its speed, first reported at about 110 mph cruise and about 75 mph, top, is now said to be about 25 mph more for each condition.

The next copier to be offered by Sikorsky will be a 16-place job, actually developed for the military, later slated for civil use.

► **Pausch—Pausch's** B-113 could accommodate about 20 passengers. It has been in volume production for a considerable period for the military. Powered by a single engine, cruising speed of the craft is in the neighborhood of 100 mph.

Another Pausch contender for the near future is its great H-86 Transporter. Two versions of the craft are in the works—one with two P-6W, B-113 engines, another with two Allison T18 turbines. A relatively speedy copier, the Transporter will accommodate 48 to 72 passengers, although it must fly with average along

■ HELICOPTERS

the lower band of five capacity range.

France's end use tandem-rotor configurations, as opposed to Sikorsky's counterpart to single-rotor jobs. Opinion is divided as to which arrangement is better. The single rotor is lighter than a dual or tandem arrangement, involves less complexity. On the other hand, the tandem allows greater cross-gyro flexibility—an important land-placement feature for both military and commercial operations. The CG trend on Paveco's TH-16 exceeds that in any other aircraft.

■ **Bell Aircraft** also favors the tandem configuration for large machines. It now has both single and tandem arrangements in production.

Bell's present project for the transport field would be a new version of its NH-119 Navy chopper. The current civil craft would accommodate about 16 passengers. Powered by a P&W R2800 engine, the configuration embodies two rotors with two blades each. This craft is another prospect for commercial availability in 1976.

■ **Composil Copters**—The composil helicopter—a combination of the conventional rotor plus additional experimental units turned on with magnetism—is in the picture for future military transports.

The Gyrodyne Co. of America has a copy of this type in its design stage. It embodies counter-rotating main rotors, plus side-rotating powerplants driving counter-rotating props.

■ **All-Weather Operations**—Looming in a large factor in the rotor transport clearance is the need for full realization of all-weather operations with rotary-wing aircraft.

Airline probably would take delivery of choppers prior to perfection of all-weather characteristics, but the prospect is that, in view of the strides being made in that direction, the problem may be fully solved when the planned commercial rotors are ready for the market.

■ **How About Noise?** A vital consideration affecting transport rotor operation is the external noise problem. Soundproofing will take care of external noise.

Where the rotor is used in rescue operations, noise has been an major factor. As it occurs into the metropolitan areas, the rotor noise problem poses difficulty. Even now, with an S-55 transport, New York Airways' flight path between Idlewild and New York airport stretches 29 mi., because of noise and safety concerns, instead of the 28 mi. direct line route.

With the rotor about 90% of the total noise comes from the engine co-

location, it is oriented. Nothing the noise appears to be a solution, but effort of shielding can make it necessary to go up in helicopters and also bring an additional weight. Gas turbine engines in rotors will lessen the noise.

■ **Waterway Routes**—In any event, the rotor's superior maneuverability and slow-speed and low-altitude capabilities will make it possible to follow a winding approach path where noise may not prove too much of a disturbing factor. These paths might be highway trails, railroad lines and waterways.

A large percentage of big cities are on waterways, and these frequently are

close to the heart of the city. Thus, waterways not only offer a means of approach but also suggest themselves as waterways for the helicopters.

■ **Helicopter Penetration**—Even though helicopter operations are far from being resolved, there is a distinct consciousness that it is only a matter of a short time before "city-center" rotor takeoff and landing sites will have to draw close attention. Airport planners already are preparing to meet the conditions.

As an example, the budget for a new large airport already is being increased because of the expected effect of short haul and 200-300 rotor traffic.

being directed to "downtown" facilities. The budget was projected to take care of the city's airport needs until 1970. Now planners believe that by 1960, about 40% of the traffic will be captured. For this reason, a substantial portion is being planned for allocation to a heliport site.

Transport Speeds

General requirements have not yet called for regions to emerge within the next few years. Discussions have been on a preliminary basis and have covered the subject in broad terms—speed and range ideas down to such details as seats and windows.

Speed—Speed capability of about 130 mph. for the metropolitan (city) operation rotor and a 150-200-mph. figure for the sparsity type have been mentioned as feasible. A compound-type rotor transport might boost the speed value to 250 mph, or more.

However, specific high speeds aren't seen as too vital a factor because the rotor won't have much trouble beating any existing city-center buses or vehicles with fixed-wing planes for the same route.

Capacity—Capacity normally indicates that not less than 30 or 35 passengers would have to be accommodated in the

intercity type, with higher local estimates ranging from 40 to 50.

For the metropolitan service type, estimates indicate 14- to 28-seat types.

Range—Fuel ranges of 200-350 mi. for full gross are seen necessary by some as active routes. There is opinion that the 200-mi. figure is too high, while others boost the upper figure to 300 mi. with a maximum payload plus sufficient fuel reserve.

Metropolitan operators would consider these general estimates too high for their requirements, which might considerably fall in a stage length under 75 mi.

Engines—Multi-engine power seems to have secured the nod. Engines for operation conditions still have not been pinpointed—whether hovering or climb-limited flight considerations will prevail.

Transport rotors will carry retractable gear, and the folding blade will be an advantageous feature to make the most of hangar space for rotor storage and overhaul work.

Military Experience

Until the expansion in civil transport rotor operation really gets underway, the military will continue as a main nucleus to probe and further develop

SIKORSKY HO4S

2,000 HOURS between engine overhauls

DELTA-C & S

FOR THE FIRST TIME in the history of the industry, the CAA has approved a 2,000-hour engine overhaul period. This authority has now been given to Delta-C & S for its Curtiss-Wright C180D engines used in its Lockheed Constellations.

This new world standard of engine reliability is a tribute to the engine overhaul, line maintenance and flight personnel of Delta-C & S.

AeroShell Oil 120 is used exclusively in these Delta-C & S engines.

■ HELICOPTERS

the numerous possibilities of rotary-wing aircraft.

What the military already has done gives only an indication of what about Marine Corps experience is a good example of what already has been accomplished and what is looked for with the helicopter.

► **Loading the Troops**—With the advent of the atom bomb it was realized that there would have to be a new approach to putting troops ashore from ships which would have to stay farther out at sea and be more widely dispersed.

Operational studies of this concept were begun back in 1947 with the Sikorsky HO4S, even though it wasn't considered to be the specific tool for the job. (It was about this time that requirements were taken up looking to a copy of the Sikorsky HO4S type.)

The Pavee HRP's also were used as an interim vehicle with great effect.

► **Marine Supply Line**—The first real combat employment of a copter came in Korea with the Sikorsky HO4S, in September 1951. Marines look at the version as a luxury matter. One copter squadron was attached to the 1st Marine Division. Three days later the division was locked in its heaviest fight yet.

By the time the war was over, the 1st Marine Division was the last to see the copter. The copter was used in the heaviest fight yet, and the copter was the last to see the war. The copter was the last to see the war.

The copter squadron did the job admirably. It is now revealed that in supplying two regiments for five days it averaged 312,461 lb. per day, 31,559 lb. per hr., with an average load of about 999 lb. About 516 loads were carried per day (actually flights per day), and roundtrip time was about 20 min. About 38 copters are reported to have participated.

Following this the squadron was engaged in other large-scale supply operations, including air and troop movements, even at night, displaying a flexibility that no unit had ever known before. Since then, the Marines have been learning more and more about how the copter fits into the tactical scheme, engaging in many ship-to-shore operations.

► **Design Come True**—As developed for the Marine Corps, the Sikorsky HO4S is just what the service arm had been dreaming about. It has more power than can now be utilized and the HO4S can be staged up to meet future operational requirements. Also wasn't to get the latest copter—the report obtained is considered a dividend over and above the requirements laid down.

The Marine Corps could not use effectively a larger copter now. The HO4S was tailored precisely to fit the

Double Barreled

Two power-packed jet engines, two "decks" of 52 rockets, two sets of controls and trusses, up to two thousand miles of wire... and the resulting assurance of single-engine performance if necessary, that's the Northrop Scorpion F-49. These U.S. Air Force interceptors now stand ready for double-duty defense at far-away bases, they can use in seconds as first radarair to intercept air raiders, and they can follow, harass and destroy them (hundreds of miles before they reach target). The long-range Scorpion F-49 is one of many precision products built by Northrop for all branches of the U.S. Department of Defense.

ORION HELICOPTERS

curtain which was expected to be used in trapping the copier to arms where they would be needed. Size of carrier elevation and launch deck was the controlling factor.

Even so, there is an upper limit to the size an assault copier should attain, although that has not yet been reached. A controlling consideration is that not too great a concentration of troops is considered advisable for assault aircraft—it would be analogous to putting too many eggs in one basket.

The HRS will be pushed to its limit by the Marine Corps to launch all-weather, night development. This phase of operation has two series in its target area under the lights. Other service areas using rotary-wing aircraft undoubtedly have the same attitude as the subject.

► Building for Speed—More speed for military copiers is seen as a sure future target. This would permit more work in a given length of time, regardless of the type of copier used—assault, transport, cargo. Faster runs would also increase vulnerability.

Just how much of a speed jump is contained therein is not clear, although today's copier speeds are considered comparatively low.

► Raising the Lift—The need for very heavy-lift copiers may be solved by tip-driven pistons, so eliminate shuffling problems involved in delivering troops from external engines.

None is there at tip-driven machines may be very delicate, but as they are designed into the fuselage in place, where the noise is behind the pilot. Is the tip-driven copier, the pilot is in the middle of a noise circle, which probably is not a desirable design. However, this operational factor will require considerable study.

► One-Man Copiers—The "individual" copier is a natural combination, or a single copier—no longer seen as a promising military development of the future.

Even as a one-man job for utility work, it does not appear feasible. The one-man copier could be accomplished more effectively and less dangerously with the two-place conventional copier as the past-future machine.

Convertiplanes

The convertiplane is thought of in some in the industry as the logical development or replacement of the copier—a sort of merged configuration combining copier and land-wing characteristics, placed mainly in the hands of the command in light speed it presents over the past copier.

A convertiplane speed of about 300

192 mph would be very attractive for some operations.

Others do not see it fitting into the actual picture at all—they say it is not practical as a copier or in a land-wing plane.

► What Is It?—The question frequently arises, "What is a convertiplane?" The definition accurately must be loose and flexible and include several embodying characteristics of both the copier and the land-wing configurations.

Those who draw a first line of distinction contend that it is a true convertiplane, initial vertical lift and the subsequent transitional flight come from the same overall propulsive system. Where this vertical lift and forward propulsion come from separate systems, the aircraft frequently is called a compound type.

Generally speaking, the convertiplane as far behind the state of copier propulsive development as the latter might not even be considered in being "as the screw ball park." The convertiplane involves more detail than the copier, more going.

► Not So Simple—Although during construction and on paper the convertiplane has been made to appear a relatively simple proposition, the effective accomplishment of such an aircraft is a tough problem even for such big and experienced builders as Bell and McDonnell. These companies, both engaged in prototype development, have copier and land-wing know-how; there is a good bit of each type in the convertiplane. McDonnell's convertiplane prototype already has been completed (Aviation Week Feb. 15, p. 17). It combines piston-propeller power with jet-driven rotor blades, has small wings.

In contrast, the Bell convertiplane will feature large slow-turning, rotor propeller mechanisms pivoting on the wings, acting as rotors for lift and forward, and as propellers when tilted forward for transitional flight (Aviation Week Feb. 15, p. 16). However, it is stated by the Army, it should emerge as a "workable" type.

Indications are that McDonnell and Bell show that both Bell and McDonnell prototypes will have good performance.

For developed convertiplane applications, the jet propellant is going to figure largely. One application seen is as a command steamer in a jet-powered shuttle bus, with the engine vertical for takeoff and rotated to horizontal position for transitional flight.

The Navy, too, is interested in the convertiplane, may even see a piece of existing military contracts.

It will be a long time, development well before any commercial interest in the convertiplane as more than just assault-copier, perhaps, for the compound type.

WHAT DO YOU NEED TO TAKE A TAILPIPE TEMPERATURE?

FOR ONE THING, A GOOD HARNESS.

It's tough to take the temperature of a jet's tailpipe. Severe vibration and extreme changes in temperature can wreck measuring equipment. Yet, this information is vital to men who build the engines and fly the planes.

The harness used for the job must be rugged enough to survive brutal operating conditions (even more brutal than jet engine thrust and temperatures are being measured).

It's from several solutions to the problem, and the rigid, ladder-type harness shown below is one of them. Extensive tests are projected from the heat, corrosion, and vibration by one piece, stainless jackets which are lined with ceramic insulation. Positive and negative conductors are isolated separately for compactness and ease of installation. Harness can be equipped with open-end or stagnation thermocouples.

Basically, it's a well-made harness that can take lots of punishment and high temperatures.

Completely exhaust resistant in tests of thermocouple material—resistant, light weight—no wear from high-temperature gases—no corrosion—allows access at bottom and high temperatures, 1000° F. or more

Get in touch with us. Let us help solve your temperature-measuring problems.

HUMAN FACTORS

Man-Machine Teamwork Is Key To Best Use of Weapons Systems

Proper consideration of human factors can make the difference between success and failure of weapons systems which must be used and maintained by men.

If and when production begins in earnest, there will still be somebody who will push the button.

Somewhere else will have to wear the cockpit, somebody else will have to maintain them, and somebody will have to think up improvements. Even if you don't carry this reasoning any farther, to include the people who design and produce production and the people who have and train those people, one very evident fact will stand out.

There will always be people.

This is the fundamental concern about in the study of human factors.

► **Basic Truths**—This simple statement has been around for some time, recognized to be greater or lesser degree.

But it has been only recently that aviation has begun to worry about the human factor relating area to the machines they fly in.

It has happened because man's evolutionary pattern has been enhanced by the pace of technology during the past century.

Today, in many cases, a military man can just about cope with the new conditions and artificial environment created by the weapons he is to use.

It is especially true in combat aircraft.

Look at a B-47 pilot, who senses through his hands and eyes and uses a precise flight path balanced on a knowledge between high-speed buffet and low-speed stall. He is out of his element.

Without his preselected reflex, his partial posture shift, his dynamic reach, he will die. Without a drill, man and non-reflective point, he will go blind.

Without self-confidence, training, a tight frame of mind, he will break under the strain.

He lives in spite of being a human, not because he is. The pilots that crowd his cockpit and drink his fuel, the escape and survival equipment under his buttocks, the production situation and the medical reports will keep him alive.

That's one way to look at human factors work—in a study of the ways to keep a human alive.

Human factors endeavor fully grasps in three broad areas: eye, medical, accident, human engineering and human resources.

► **Area Medical Sciences**—Aviation

medicine is one specialized study among the many broad studies this broad heading. The Area Medical Laboratory at Wright Air Development Center of the USAF Air Research and Development Command has a project for which includes protective clothing of all types, flight feeding, survival equipment, a resuscitator and a spray-on burn dressing.

The extreme variety of the lot is a tipoff to the complexity of the area medical job.

It won't always do. Primary effort used to center around the flight surgeon, his chief concern was preventing disease and curing sickness or battle injuries. Once in a while he was able to give prophylactic care, if he had the background and the available time.

Now a flight surgeon faces as if he were going to be a pilot, he frequently finds on training or routine missions with the eyes under his care.

There is considerable new medical research devoted towards methods of helping a man stay alive in the air environment of the cockpit.

What effects do altitude and atmospheric vibration frequencies have on pilots and ground crew? What is the toxicity of a new lubricant used in a jet engine, from whose compressor contamination it may be held into the cockpit? How old can a pilot get before he must be grounded?

These are some typical problems of the new medical sciences.

► **Human Engineering**—Here the problem is to engineer the machine so that it can be operated by a human of normal dimensions and capabilities.

Every engineer who has ever designed a plane or a component knows that once in his career he has called for a room where an human hand could hold a backup bar to lock up the rivet. These same engineers have not had an awareness of the pilot's problems either. They have located switches in open locations where vibration and man-machine wear would be the only trouble was that a pilot would need either a repositioned arm, or a third arm to flip the switches.

One of vintage cockpit engineering came after better exposures. Our air plane had a gun restriction lever in the

IN TERMS OF PROFIT...

PERFORMANCE...COMFORT

THE GREATEST AIRLINERS EVER BUILT!

Latest model of the famed Douglas DC-6, the DC-6B represents the ultimate in this series of great, four-engine air transports. It was the DC-6B which flew 5700 miles from Los Angeles to Paris last May in 20 hours to complete the longest non-stop flight ever made by a commercial airliner.

The superior performance of this airplane under all conditions and its acceptance by the flying public have established it as an outstanding profit-maker.

DC-6 SERIES

DC-7 SERIES

Already 88 of these new turbo-compound sky giants have been ordered by the airlines. This brings to a total of 476 the number of DC-6, DC-6B and DC-7 airplanes delivered by Douglas or under construction. So aerodynamically clean...so powerful is the DC-7 that it is the only commercial airliner making scheduled non-stop flights both ways across the United States. It is designed for maximum operating profits and to bring the air traveler comforts never possible before.

"Queen of the Fleet" on these leading airlines of the world is the famous Douglas DC-6 or DC-6B

■ HUMAN FACTORS

identical spot where another had the tailhook lock. A compass failure was on the left in one crash, a later crash location put it on the right.

Pilots would fly these types into changeably, a high accident rate was the inevitable result.

Some observers of human engineering believe that the greatest single contribution of the study of human factors is in the great advances made in standardized cockpit layout, control layout and motions.

► Human Resources—This phase of human factors work considers the relation of the individual to his environment. Specifically, methods of selection of flying personnel, their training and procedures would be studied in this field.

But there is a broader aspect opening out of the relation between man and the world around him. The complexities of psychological warfare, the impact of various weapons on a social or political group, the several phases of intelligence are all part of the human resources picture. So is group and individual morale.

So human factors is geared one step over into almost any line of endeavor, simply because the study is based on the fact that doesn't always be people.

In the Air Force, three former ARDC human resources research units recently were integrated in the AF Personnel and Training Research Center.

Under one heading came their aircraft laboratories, including the range and upgrade of human factors work is just one USAF command Personnel Research and Skill Components Research, Aircraft Observer Research, Training Aid Research, Armament Systems Personnel Research, Crew Research, Joint Pilot Research, Interceptive Pilot Research, Officer Education Research.

It has taken designers and engineers a long time to realize that human limitations and abilities ultimately determine the effectiveness of hand-operated weapons. There is still considerable controversy between the proponents of pilot comfort and those who favor the Spectra approach. There are still those who believe that an aircraft technician is created by command and not by ability.

But the fact that there has been a continuing undercurrent of consideration of the human angle is encouraging. From last generation of the problem, through initial exploratory contacts in partial understanding, the study of human factors has grown at an amazing rate.

It promises to be one of the most important phases of technology ever considered as scientific research, development and design.

QUICK PICKUP!

with an Aircraft Hoist

by

■ Whether you want to pick up a 160-lb. man or 10,000 lbs. of cargo, BREEZE can engineer the right winch-hoist for your needs.

We have developed a new line of cargo hoisting hoists and winches that offer the advantages of compactness and precision performance.

All feature a high rated load in relation to extremely light weight. All have special overload and safety features to meet the exacting standards of the advancing aircraft industry. For the newest in electrical, mechanical or hydraulic hoists, consult BREEZE engineers.

DOUGLAS DC-7

Airline Gains Continue as . . .

Air Transport Records Its Biggest Year

By Frank Shea, Jr.

The air transport boom continued to increase in 1953, as the airline industry experienced the biggest year in its history. New peaks topped almost all previous records.

- Revenues of U. S. scheduled and non-scheduled airlines for a record high of about \$14 billion for a gain of about \$140 million over 1952.
- Total revenue ton-miles climbed up around the 24-billion mark for an increase of approximately 260 million.
- Domestic ton-miles accumulated more than 14 billion passenger-miles, a jump of nearly 18% over 1952.
- U. S. international operations experienced record traffic gains, as well as a big net in net operating income.

Total operating income increased by more than twice as much as total operating expenses.

Continued gains are forecast for 1954, both domestic and international, but they are not expected to be quite as sharp.

Traffic in the last six months of 1953 did not maintain the very favorable rate of increase it enjoyed during the first half of the year, and this is taken as an indication of a slight leveling-off at the boom that has characterized the industry since 1948.

Heavy deliveries of new aircraft are causing a drop in load factor (pushed as a percentage of capacity), and, at the same time, higher operating expenses to amortize the new equipment.

Higher overall operating costs, possible subsidy cuts and heavier competition from kerosene-fueled carriers are also big factors.

But the industry, on the whole, is ap-

prosperous. The trend is still upward, and most carriers are looking forward to another big year.

• **Predictions for '54** Even better—The 1954 forecast for all the world's airlines, excluding those of Communist countries, is a 10% payload increase over 1953. International Air Transport Association predicts that its 69 member airlines, who presently handle 35% of the world's commercial air traffic, will see a 10% increase by 1954.

IATA estimates that carrier will spend about \$200 million for over 300 transports scheduled for delivery during 1954 alone.

So the world-wide industry outlook is for another record-breaking year, with gains not as marked as last year but still substantial.

• **Cause for Optimism—Optimism** at U. S. airports is based on the following trends:

• **Domestic ton-miles** continue to make strong strides in rail traffic. Transline passenger-miles were approximately one-half of first-class in 1948. Today, they are about 70% greater than Pullman-type traffic and about one-third of the total rail passenger tonnage.

• **Coach service** is still as the upswing and continues to be a significant factor in airline expansion. This type of traffic has made tremendous gains, in many instances more rapidly than standard

CONVAIR 440

LOCKHEED 140C

service. Big factor is that it has brought air travel within reach of the lower income brackets.

Airlines are now entering to these groups, constantly extending coach service to an increasing number of cities. The experiment began with three cities in 1948. This number swelled to 27 the following year, and by 1951 a total of 35 cities was served by coach.

In 1952, domestic coach traffic accounted for about 70% of coachload coachload class traffic, covering 47 cities. Last year, it climbed to 38% of the total in seven more cities was added. Even stranger gains are forecast for 1954.

• **Transline** road service is expected to push up substantially during the year. Big factor here is the growing Post Office experiment of shipping preferential first-class mail between major cities by air instead of and where cars are competitive. This should offset the decline in ordinary mail.

Post Office experiment presently encompasses service between New York

Newark and Chicago, between Washington, D. C. and Chicago, as well as New York, Chicago and Washington to major cities in Florida.

Rates on the New York/Newark-Chicago run are set at 15.65 cents per mail ton mile, while Washington-Chicago is 16.04 cents. American, Capital, TWA and United are the carriers involved.

Delta, C&S, Eastern and National Airlines are participating in the Florida segment. Delta and Eastern, from Chicago to Jacksonville, Tampa and Miami, receive 20.04 cents per mail ton mile. National and Eastern receive 16.04 cents from Washington and 13.65 cents from New York/Newark.

Post Office also has enlarged the experiment to include transoceanic carriers, holding that their services should be used in emergency instances where movement of surface mail would otherwise be delayed.

In the light of aerial success in these test cities, Air Transport Ass'n is urging airlines to give full support to a nationwide expedited mail program in which

all first-class mail would go by air when the distance to be covered is more than 400 mi.

ATA proposes a straight five-cent per surface postage rate for all non-rail first-class mail, including domestic air-mail. Such a program would increase domestic airmail volume by an estimated 117 million ton-miles annually which, at prevailing rates, would pay the carriers approximately \$35 million.

It is considered doubtful that such an extensive expedited system will be put into effect during 1954, but it could come soon. There is a definite trend toward more air transportation of surface mail, and as it gains momentum, results will show up in freerline mail revenues.

• **LT capacity** of domestic and international scheduled air services has gained 47% over the past three years, while operating income has increased only 19%.

Those over 1,335 aircraft in operation in all June 1953, compared with 1,141 in mid-1950. However, these planes, mostly larger and faster types, now carry a billion ton-miles a year more than the 1950 fleet.

A greater percentage of available ton-miles continues to be used. In 1952, domestic ton-miles had 1,394 million ton miles available, flying 949 million tons last year with 1,629 million ton-miles available ton-miles are charged to 1,942 million.

• **Fleet additions** last year included five transport models that were not in service in 1950. Convair 440, carrying 40 passengers; Douglas DC-6B, seating more than 90; Lockheed 140C Super Constellation, with capacity for more than 70; Martin 40-6, holding about 40; and the Douglas DC-7, with a same capacity as 45.

Delivers of the Convair, Lockheed and the Douglas planes will continue throughout 1954.

Leader is the DC-7, latest addition

MARTIN 40-6

AIR TRANSPORT

that the contest was in which one technique can be gained in through reduction in the general level of fares. Any such reduction, however, is dependent for its continuation on a considerable increase in the volume of traffic in order to maintain satisfactory volume revenues.

A look at the record over the past year gives ample evidence of the increasing tendency toward lower scheduled fares.

In 1945, a company from Atlantic crossing cost about \$600. Last year, it was down to two-thirds of that level for first-class travel (\$397). As a result of Pan American World Airways' crusade for lower international round-trip service, ticket fares went down more than 50%.

This year, 25% cuts are scheduled for trans-Pacific fares. Pan American also is effecting a \$400 drop on its round-the-world service, offering round-trip flight for \$1,300 as opposed to \$1,700 for first-class.

► **1946 Outlook**—Several factors will have tremendous influence on U. S. flag-carrier operations in 1946.

► **Supercost Coast effect** decision, if the full interpretation is applied, could result in a major reshuffling of flag-carrier schedules, with TWA, Northwest, Boeing and Delta-Cock possibly having to drop international operations.

In its ruling, Supercost Coast held that excess profits arising from domestic operations must be offset against worldwide operating requirements. Since TWA, Northwest, Boeing and Delta all have combined domestic-international operations, the decision could be crippling.

Pan American is the only airline that would stand to benefit, since it has no domestic service whatsoever.

► **Heavy subsidy** studies would also have drastic effects. House Appropriations Subcommittee has set \$13 million off CAA's request for \$50 million subsidy.

Comparative transport costs

Direct operating cost per U. S. domestic plane-mile

9 mos. ending Sept. 30, 1953

	Flying expenses (Cent)	Direct Maintenance (Cent)	Depreciation (Cent)	Total Direct Oper. Cost (Cent)
Douglas DC-3	31.97	11.10	3.68	46.66
Douglas DC-4	46.85	18.88	4.55	69.95
Convair 440	44.37	11.69	11.88	67.94
Convair 440	44.28	14.99	10.13	69.40
Martin 40-4	43.16	19.35	16.84	79.35
Douglas DC-4	55.15	31.63	16.57	103.35

Lockheed T44B	54.09	23.40	40.42	117.91
Boeing 377	84.58	40.20	36.82	161.60

Source: Air Transport Association compilation of uniform Form 47 reports by domestic airlines to Civil Aeronautics Board.

General industry feeling is that such an extensive cut won't stick, but reduction of some sort seems certain.

► **Decisions on route cuts**, several long-pending, could have far-reaching effects on international costs. This year possibly will see changes on such controversial routes as New York-Boston Through-Service Proceeding, the Trans-Atlantic Cargo Case, Resort Airlines Mount Skipper Investigation and the States Alaska Case.

► **Seasonal problem** must be resolved, especially on North Atlantic routes. Contracted traffic gains will depend largely on assumption of more winter traffic.

Jet Transports

The era of the jet transport continues to focus on the business for both domestic and flag airlines. Leading contenders are Boeing's de Havilland Comet 3 and Boeing's Model 707. ► **Certification** for Comet-Pan American has three Comet 3s presently on

order, with seven more on option. But CAA certification is the big obstacle to be overcome before the Comet can see service in U. S. waters.

As yet, CAA has not given sufficient information to articulate the possibilities for certification. First model is expected to fly this summer, to test the 317's first flight.

CAA will be especially cautious about certifying Comet 3s in view of the analyses of Comet 1s over the past 15 months. Certification is considered doubtful in 1954.

► **Boeing 317-Boeing's 717** is expected to hold a considerable edge in speed and power over five Comets. Data available indicates that the 717 will cruise at the near 600 mph class, presumably around 580 mph. But the air liner may achieve Mach 1.04 speeds in normal transport operations as high as 510 mph for some distances.

This would give Boeing a considerable advantage over de Havilland, now quoting 470 mph speed for the Comet 1, 500 mph for the Comet 3 and

Rheem serves as a prime contractor to the United States Government . . . and as a sub-contractor to Lockheed, Northrop, Douglas, and Westinghouse — leaders in the world of aviation.

How does AVIEN maintain this "BALANCE OF POWER"?

A current tanker aircraft specification calls for large fuel tanks fore and aft. Obviously the pilot must know the fuel quantities in both systems. What is more, this stored power must be distributed "in balance" equally between the two.

Control of the plane's center of gravity and constant, accurate indication of fuel quantities are both handled automatically by an Avien voltage-fed balancing system and the well-known Avien Fuel Gages.

Fuel weight distribution data are supplied by one additional potentiometer in each fuel gauge indicator.

A typical Avien safety feature is incorporated in the balancing amplifier. It detects and warns of a pump or valve failure in either system.

The entire installation has been achieved by Avien with a minimum of weight, complexity and cost. This

is another example of the essential adaptability of the Avien fuel-gaging system which can be "tailored" to the exact specifications of many different aircraft.

Every month, Avien produces over ten thousand major instrument components for the aviation industry. They have been specified for more than fifty different aircraft models.

If you have a fuel gage or fuel management problem, call on us.

FAIRCHILD C-119

MATS Operation Set for Peace or War

World's largest air transport operation holds record of flying 500,000 persons over 115,000 miles to 38 countries without a fatality.

Military Air Transport Service, world's largest air transport operation, during 1955 carried 500,000 passengers without a fatality since 115,000 mi. of international air routes to 38 countries.

MATS is made up of three divisions: **• Pacific Division.** Commanded by Rear Adm. William D. Johnson at Hickam AFB, Hawaii, this unit is responsible for air supply of U.S. Far East Forces in Japan and Korea, and military convoys to isolated countries as far as Okinawa, South China. Aircraft assigned to this division made 3,800 trans-Pacific flights in 1955, haul 217,000 passengers and patients and 34,750 tons of cargo and mail. This is less than the 1952 record because of the Korean airlift cutoff.

• Atlantic Division. Based at Westover AFB, Mass., and commanded by Brig Gen. John M. Hopkins, this division directs transport operations across the Atlantic to Europe and Africa, linking with the Pacific Division at Okinawa.

Atlantic Division also supplies strategic Thule AFB in Greenland. During 1955, Atlantic Division flew 398,648 passengers and patients and 31,516 tons of cargo and mail. Thule flights alone carried about 18,000 passengers and 5,500 tons of cargo. The Division plans to move soon to Dover AFB, Del.

• Continental Division. Maj. Gen. James S. Stowell commands this division from Kelly AFB, Tex. Its post-war mission, in addition to air support, war evacuation and training. Continental's operations also extend to Alaska, Canada and the Caribbean area. Its routes join with the Atlantic Division at Westover AFB and with the Pacific Division at Travis AFB, Calif. It carried 91,000 passengers and patients and 4,400 tons of cargo in 1955.

The three divisions during 1955 flew more than 1 billion passenger-miles [83 million patient-miles and 518 million ton-miles].

• Routes—Basic routes today are:

Mid-Pacific route from Travis AFB to Hawaii through Wake Island to Tokyo. Another route extends from Okinawa to Guam, Manila and Saigon through India to Ceylon. The North Pacific route starts at McChed AFB, Wash., through the Aleutians to Tokyo.

North Atlantic route begins at Westover AFB through Newfoundland and Iceland to various points in Europe to AFB through Dublin. The other Atlantic route extends from Westover AFB through Newfoundland and the Azores to Scotland and Europe. Currently the Atlantic Division is running a passenger and cargo route from Westover to Thule AFB by way of Goose Bay, Labrador, and Søndmøro AFB, Greenland.

Continental Division's basic air-

moed aircraft route runs from Travis AFB to Kelly AFB at Brooks AFB, Ala., to Westover AFB.

Within the framework of these routes, MATS operates intra routes and schedules in military requirements demand.

• MATS Fleet—Among the approximately 600 four-engine transport aircraft operated by MATS are the Lockheed C-119, latest plane in the stable, the Boeing C-97, the Douglas C-74 (a MATS squadron at Brooks AFB operates all of these aircraft over land); the Douglas C-124, the Lockheed C-131 and the Douglas C-117. So far a major factor in this effort is the Douglas C-94.

The two-engine C-119A will be added to the MATS fleet as an executive plane in the near future. It is the first aircraft with a special interior for successful service. Recent craft include the Boeing SB-17 and SB-28, Cessna SA-16, Stearley HS-5 and B-19, and the Fieseler HE-11. Transition training planes are the North American T-6, Lockheed T-33, North American T-51 and Republic F-84, light loads, check plane, the Lockheed F-80. Other planes include C-47, WB-29, B-17, B-24.

Backing up the MATS fleet of transport planes is the Civil Reserve Air Fleet Plan. CRAF calls for the mobilization of about 600 civil transport aircraft and classifies the MATS fleet in the event of a national crisis.

• JCS Set Requirements—Gen. Joseph S. Smith, who commands the entire MATS operation and its 100,000 military and civilian personnel from Andrews AFB, Md., is quick to point out that while MATS operates scheduled

CHASE C-124

flights in the near future is occasional airlift, but scheduled operations are based entirely on providing the airlift requirements dictated by the Joint Chiefs of Staff. "The military situation determines the routes and schedules to be flown," he told *Air Force Week*.

House Appropriations Committee, in a report on fiscal 1956 Defense Department funds, sharply criticized the MATS operation, stating that USAF directors had taken MATS far beyond its original mission of providing air transport for defense agencies. The committee charged Air Force directives indicate that training and tactical support is the primary mission, and complained about the assignment of Air Force Service, Air Weather Service, Air Materiel Service, Air Communications Service and Air Photographic and Charting Service as a MATS responsibility.

• Remarks—The committee, though, urged that MATS be limited to air transport operations, and that it be established on an industrial basis similar to Military Sea Transport

Service. Defense Secretary Clark M. Boardman opposed the idea. MATS is self-maintaining a substantial combat position. "We will operate MATS just as we are directed by higher headquarters," a top staff officer said.

Gen. Smith is proud of MATS operational readiness, and that as U.S. operations, wherever he may be stationed, more than 60 hr away from a U.S. hospital.

"It's no thing in peacetime what we shall be called upon to do in time of war," Gen. Smith said. "Our doctrine was of life with air support fully rounded peacetime military readiness. But it is imperative that we maintain tactical readiness—a hard core. This applies to all military logistics."

Other directors of the Air Force are concerned training during peacetime toward the military commitment it and when an enemy strikes. As any other military unit we too are concerned in wartime with supporting our combat operations. But, while other elements are concerned primarily with training,

MILITARY TRANSPORT

we actually are fulfilling a profound military commitment."

• **Fly Super Cousins**—MATS was established in June 1945 with the integration of the Air Transport Command and the Naval Air Transport Service. This was the first instance of combining two separate U.S. military services into a permanent organization.

The vice commander of MATS is a Navy officer—Rear Adm. T. B. Williams. Four Navy transport squadrons (each roughly comparable to a USAF group) are assigned to MATS. Two squadrons are based at Hickam AFB, one at Moffett NAS, Calif. and the other at Westover AFB. One of the Hickam squadrons flies R7Vs, the only Super Constellations assigned to MATS.

► **Technical Support Services**—Other side of the MATS operation is the technical support services which drive Congressional citations for assignment to MATS. These include:

Arctic Weather Service. This organization operates a worldwide meteorological service with detachments at all Air Force bases in the U.S. and abroad. Six reconnaissance squadrons, using WB-57s, are engaged in a constant search for vital weather information. They fly 312 duty hours each day. One of the most important tasks of this organization based on Omaha, is to report weather based on C-130s, made 107 penetrations into 18 regions. A force of 12,000 operates AWS' free weather centers, over 400,000 contacts, 253 forecasting units, 214 observing units and 50 upper air units in 26 countries. It is commanded by Maj. Gen. W. G. Seavey, scheduled to be replaced by Brig.

Gen. Thomas Moore in April. **Airways and Air Communications Services.** This unit operates more than 2,000 facilities from 153 airports all around the world. It makes available a series of fixed astronomical point-to-point and ground-to-air radio channels, optical channels, towers, navigation aids, and a large number of other facilities for navigation, as collected and transmitted. Highlight of last year's operations was the establishment of the first of many RACEC (radio air traffic control system). These centers enable AACS to establish precise radar control of aircraft approaches to military fields. AACS is represented by Maj. Gen. R. Blair Cochran with headquarters at Andrews AFB.

*As Photographic and Charting Service. Production and distribution is direct, across-the-board publication and no target information are the prime responsibilities of AFSC, which was assigned to MATS in April 1952. The unit also produced 111 sets of sound and silent film for USAF use in training.

Gyro assembly. Honeywell gyros are assembled in a conditioned, pressurized room, guarded by a double air lock. To control but not lose workers are required to wear special caps and gloves.

Envelopes are in place—in many gyro operations. Here a gyro needle is used by pressure to perform critical operations—dirt of course, a man never wears gloves but he does make a gyro.

Quality must pervade every aspect of the gyro. Here the gyro is not only, where every part is precision for accuracy before gyro is completely assembled. Each gyro is tested at 20,000 rpm for 24 hours.

Got a job for an airborne gyro?

We have the gyro for the job

That reason we can make this statement is that today at Honeywell we're *guiding* in gyro.

We are the leader in the field. With ten and production facilities unparalleled in the industry, we're needed to produce thousands of precision gyros a month. Honeywell's gyro line includes Vertical Gyros, Gyroscopic Vertical Gyros, damped and undamped Rate Gyros and the highly sensitive, yet rugged line of fully fused Honeywell Integrating Gyros.

Our gyro "family"—which was originally developed for use in Honeywell automatic control systems—is now available to manufacturers who require precision performance. A letter to Honeywell Aero Division, Dept. 656, Minneapolis 13, Minn., will bring full details.

The Honeywell gyro "family" will continue to grow, as part of our complete line of controls for everything that flies. Because automatic control is important to aviation's progress. And automatic control is Honeywell's business.

MILITARY TRANSPORT

ing and equipment. Big G-1800 M-1 Day commands the commander at Orlando AFB, Fla.

• **Air Rescue Service.** Operating 43 squadrons which fly the S-16, the H-1, H-19 and H-23 helicopters, and S-17 and S-19 Helicopters, ARS provides a global search and rescue service for USAF crews involved in aircraft accidents. This service is also available for civilian aircraft crews and locally foreign aircraft. During the Korean war for 3rd Air Rescue Group in Japan and Korea completed 9,600 rescues within the combat area. ARS is commanded by Brig. Gen. Thomas J. DeLoach. Headquarters are at Orlando AFB, Fla.

• **Flight Service.** This unit delivers flight plan messages to bases of defense from within the U. S. This is accomplished through a network of airphone and teletype lines connecting all military and Naval bases, direction finding stations, Civil Aeronautics Administration bases, and other traffic control centers and air defense control centers. Non-communications will connect 85 stations with all very high-frequency and ultra-high-frequency direction finding stations. Pilot formerly could rely on air-traffic beacons from a single DWS, can now obtain advice through the new Flight Service DP evaluation center. Col. Harry J. Bellis commands FS, which is scheduled to move from Washington, D. C. to Orlando AFB.

• **Training and VIP Service.** MATS also operates an aircraft flying service under the Continental Division command of these squadrons—two jet and one turbo-prop—based at Dover AFB, Lang. Beach, N.Y., Calif., and Annapolis AFB, Tex. The training squadrons have been disbanded since 7,000 aircraft in the U. S. and overseas.

The 125th Air Transport Group, based at Washington's National Airport, handles the special-VIP—such as: One of the longest flights made by aircraft from the 125th was Vice President Richard Nixon's postwar mission. The Lockheed C-141 flew 169 hr. and traveled about 46,000 mi.

Airfield MATS mission is the support part of the Strategic Air Command. Written down after the Communists struck across Korea's 38th parallel. MATS was ordered to support the move of two SAC command headquarters to the Pacific. Two types of aircraft are provided. First is the normal military of SAC units and equipment from the home station to the temporary duty SAC base. Second is its main support which provides service at MATS bases along the route to the destination.

—GPM

SELF-PROTECTED ELECTRIC POWER PLANTS

A mobile source of electric power for storage, providing and testing aircraft, ground station and related equipment. The unit supplies both AC (400 cycle) and DC power and has a 3000 lb. storage capacity. Optional equipment—compressed air (1000 psi) hydraulic power, torque converter, vibration-shield equipment. These power plants are being supplied to the U. S. Navy and U. S. Air Force.

TEST EQUIPMENT, INSTRUMENT AND CONTROL PANELS

Weather, hydraulic and electronic test stands and portable testbeds in military standards and expressed in most specific industrial needs.

GENERATOR SETS

Gasoline and diesel engine-driven AC and DC power for use from 50W to 250 KW, and in order required, open or closed. For aircraft servicing and general power.

"MAGNA-SWEEP" SELF-PROTECTED MAGNETIC SENSORS

For clearing airports, runways, highways and industrial areas. Completely self-contained, with magnetic sensor, amplifier and control panel.

AIRCRAFT GROUND SUPPORT EQUIPMENT

Consolidated Diesel Electric is a major supplier of ground support equipment for commercial and military aircraft. Consolidated equipment of all types is giving top performance in airports and on bases throughout the world.

In addition to standard units, special machines have been developed to solve complex servicing problems. Consolidated engineers are specialists in designing for the advanced requirements of the private industry.

We are at your service to help fill your specific needs.

MAGNESIUM

by **ALCOA**

Aircraft engineers are taking a second look at magnesium! Until recently, this metal was considered best for only minor castings—but sound technical advances have been made in alloying, heating and casting this modern metal.

Today, Alcoa operates three magnesium facilities at Verona, California, Cleveland, Ohio, and Buffalo, New York. At Alcoa's Buffalo Works, magnesium castings weighing upwards of three hundred fifty pounds are being cast! An example is the forward section of *Avco's* newest, more powerful jet engine in production—Pratt & Whitney Aircraft's revolutionary J-57. This leading engine builder makes full use of magnesium's strength and lightness. Other applications, too, like gear housings on giant helicopters, are cast of Alcoa's magnesium. But this alone does not make these castings unique. Alcoa's team of magnesium experts also turns out dry castings which weigh but a few ounces. The difference is man effort. From start to finish—from alloy selection to final inspection—these specialists watchdog every casting.

If you'd like more information on Alcoa's abilities . . . and facilities . . . just call your nearby Alcoa sales office. The number is listed under "Aluminum" in the classified section of your telephone directory. Or write ALUMINUM COMPANY OF AMERICA, 1800-C Alcoa Building, Pittsburgh 19, Pennsylvania.

Drive light aircraft wheels of Alcoa magnesium—like this type, used on the Air Force's B-47 "Stratojet" bomber.

A challenge as exacting as casting the magnesium around turbine steel blades to form a solid, complex casting.

Another intricate job, this one a light weight engine support for a Pratt & Whitney Aircraft turbojet engine.

ALCOA ON TV today the world is not content with "THE TV SHOW" featuring Alcoa's Magnesium Castings on over 100 TV stations.

AIR TRANSPORT

Airfreight Faces Uphill Struggle

Despite gains in 1953 and rate rise late in year, profits are still marginal; cargo carriers fight for part in mail plan.

By Richard Rubenstein

Although 15% more freight was moved by the nation's air cargo industry in 1953 than in the preceding year, airlines were well aware at the end of the year that they still were involved in an uphill struggle.

Roughly 130 million tons miles of freight was carried during the year. Profits were marginal for the big trunk airlines. The independent cargo carriers did not fare so well.

Big factor seemed to be that the industry still had a long way to go, because the airfreight business represented no more than 1% of all cargo carried throughout the country during the year.

► **Profound Effect**—Four incidents occurred during 1953 which, by the end of the year, were beginning to have a profound effect on air cargo carriers.

► **Rate increase** averaging 12% in November.

► **Curbside** of the Pacific airlift.

► **Major** of Flying Tiger Line and Slick Airways.

► **Postmaster General Arthur Summer** told's aid experiment.

► **Marginal Returns**—Civil Aeronautics Board accused the airfreight tariff (Aeronautics Week Nov. 2 p. 7) as too good for Slick and Flying Tiger either in the year. Slick contended that, due to higher expenses, the present rates produced marginal-to-low returns on average versus despite high load factors.

However, the Board's order became effective Nov. 20 late to have much effect on 1954's overall freight business. Loss with the rate increase, trunk carriers saw little chance of bettering their profits in any great degree this year.

Essay F. Johnson, vice president and general manager of Aer Corp., Inc., said airfreight would increase only about 25% in 1954.

"You simply can't scale money in the cargo business yet," he declared, adding that one reason is simple the sign of "artificial growth" of the industry. ► **Adult Phases**—Continued of Korea business in June forced a curbside in the Pacific airlift. By the end of the year, nine of the trunk carriers were involved. Of the independents that had received authority left completely, only California Eastern Airways, Occident National Airways, Seaboard & Western and Transocean Air Lines remained.

By Mar. 31, all will be placed out to the Defense Department (later over the left). Phases of the airlift will provide added capacity for commercial airfreight traffic during that year.

Loss of left contracts by the other carriers involved placed some of the independent airlines in precarious financial positions.

► **Seen to Industry**—Major of the two biggest independent all-cargo airlines, Tiger and Slick, was viewed as a boon to the entire airfreight industry. Because the company was not approved by CAB said Box 7 (Aeronautics Week Jan. 18, p. 80) it had little effect on the two airlines' 1953 business.

William E. Holten, Slick vice president and traffic, said, however, that 1954 would be the biggest year yet for the newly formed consolidated Flying Tiger company. Time spent by the two firms in fighting each other in the past now can be concentrated on big trunk carriers, he said.

That, said Holten, would bring about

SCOURGE OF THE STEALTHY!

Thanks to structure built by Goodyear Aerospace, almost instantaneous radar scans, provided in the Radar Section of the Pacific Airline Corporation, are being provided for the Navy and Air Force.

To build a ring of radar around our far flung perimeter of defense called for structures which could withstand hostile winds of 75 knots velocity, yet light and mobile enough to be shipped "knocked down" via air to remote bases.

Goodyear Aircraft teamed up with the company which had developed these long-range radar units to meet the need.

Goodyear's task was to build the support structures and the huge radar reflectors—"dishes" approximating 40 by 16 feet—yet the whole

unit had to be rugged, lightweight and portable! Aluminum castings, tubular metals and special welding techniques were used to produce the frameworks—and today these new radar units stand guard as rugged sentinels along the Free World's rim.

Building precision structures is an example of the kind of teamwork and versatility the aeronautics industry has come to expect from Goodyear Aircraft Corporation—producer of plastic couplings, fuel tanks, radomes, fuselage shells and major aircraft components as well as complete airships and airplanes.

Goodyear Aircraft Corporation, Akron 15, Ohio and Lockheed Park, Arizona

Watson, California plant of Johns-Manville where enlarged facilities are now available to manufacture Thermoflex blankets and other high temperature products for the aviation industry.

Johns-Manville expands production to make Thermoflex Insulating blankets

Production facilities in new specifications, Thermoflex blankets meet all standards for heat, flame, impact, corrosion, impact and other standards. These blankets combine maximum insulating, light weight and low thermal conductivity.

Ranked by the World's largest aviation laboratory as the J-M Research Center, Manville, John Manville, Inc. and John Manville Manufacturing, Inc. are now confident with the design and industrial services of this laboratory, to solve your thermal insulation engineering problems.

Enlarged facilities plus J-M insulation engineering service teamed to solve Aviation Industry's internal insulation problems

Johns-Manville has expanded its manufacturing operations to meet the aviation industry's increased demand for Thermoflex® blankets. With its new production capacity in Watson, California—its address to other manufacturing facilities at Manville and Knoxville, New Jersey—Johns-Manville now has production facilities on both the West and East coasts.

These remote inside blankets, as referred by Johns-Manville, have gained wide acceptance for modern 14-16, 18,000 and 20,000 psi aircraft against the intense heat of jet power. Moreover, no more present and future needs, other J-M high temperature insulations are available.

able, and new and improved products are constantly being developed.

The aviation industry can also draw on the insulation design and engineering services offered by Johns-Manville. Through its trained personnel, Johns-Manville can help solve your thermal insulation problems... and specify insulating materials related to your most existing needs.

You can rest assured of this complete insulation engineering service simply by calling the nearest J-M district office. Or write to Johns-Manville, Box 60, New York City 16, New York.

Thermoflex is a Johns-Manville registered trademark.

Johns-Manville PRODUCTS FOR THE AVIATION INDUSTRY

■ AIR TRANSPORT

an engineered and flexible freight service for the company. Combined, the two airlines will make up the world's largest airfreight fleet, with four DC-6As, 11 DC-4s and 45 C-46s.

Together they carried nearly half of the freight flown domestically in 1953. ▶ **Successful Experiment—Porter** General Semanick's experiment to fly a certain percentage of first class mail by air between New York-Chicago and Washington-Chicago was pronounced so successful that it was extended last month to Florida.

Airlines now involved in American, Capital, Trans World, United, Delta-CSS, Eastern and National. Semanick's experiment will have more effect on the volume of airfreight moved in 1954 than it had in 1953 traffic, once it was not begun until October of last year.

At the end of 1953, the all-cargo season was closing for participation in the mail plan. Robert W. Pascoe, president of Flying Tiger, said of the experiment:

"It seems inconceivable that the all-cargo airlines will long be excluded from an experiment which promises so much by way of savings and improved mail service. The airfreight industry is confident that some day, somewhere the first-class and preferential mail will go by air, in stage planes and at costs geared to cargo plane operations."

▶ **Airfreight—Fleet-Expansion** view, the air cargo industry continued to use the older Curtiss C-46s, Douglas C-47s and C-54s, many leased from the Air Force, and the newer Douglas DC-4s. During the year, National returned its C-46s to USAF and replaced them with cargo-type Lockheed Lodgans.

Best bet for the present and nearest air future appeared to be the DC-4s, cargo version of the DC-6 line. Air Corp's Johnson said there it is now set for a cargo type out of the line.

▶ **Billion Ton Miles—Although** airfreight appeared to be a slow-growing business in 1953, when much experts in both surface and aircraft manufacturing companies predicted the billion ton mile mark might be achieved by 1960.

Pascoe, of Flying Tiger, was more optimistic. He said "If the general business level shot up or rose in 1953, he said, the airfreight industry should enjoy a record-breaking year of growth."

"Airfreight is, and should be, a separate industry, not a mere add-on to the passenger business. If it is a specialized service to meet specialized requirements. In fact, passenger traffic operations do not mesh well with freight flying, which explains in part the general lack of interest in airfreight development among combination carriers."

Revere INSTRUMENTS SEE WHERE YOU CAN'T

See Revere... if you need to know — **HOW MUCH LIQUID — HOW LITTLE — AT WHAT LEVEL**, Revere's precision made instruments are your unfailing eyes that are into sealed tanks, tubes or complex fuel lines. They can provide you with accurate measurement of liquid level regardless of pressure or temperature changes, vibration or rapid acceleration forces, AND they will automatically transmit a warning signal whenever liquid flow or level maintenance varies from a pre-determined value. These hermetically sealed, magnetically actuated instruments employ balanced float assemblies to minimize false

alarms. Compact and light, Revere instruments meet government specifications. They are available in many different configurations, some of which include relays to handle heavy electrical loads. Others are designed for complete submersion in fluids.

Submit your control problem to our Field Engineering Department today. **Revere will provide the instruments to suit you — HOW MUCH — HOW LITTLE — AT WHAT LEVEL.** Shows below are some instruments that say the employees of aircraft and industry.

FLOAT SWITCH
Specially designed with single or dual float systems to provide automatic control based on single point high pressure sensing.

FLOW SWITCH
Provides instantaneous warning signal whenever liquid flow falls below a pre-determined value. It can be mounted in any direction.

INDICATING SWITCH
Bench the pressure of fluid in a line without indication in wiring and transmits a warning signal if fluid conditions change.

LEVEL LEVEL SWITCH
Used to monitor reservoir high level, low level or optimal level control of fluids, water-based systems, beverages, etc. and other liquids.

■ AERONAUTICAL ENGINEERING

Supersonic Research Looks for New Answers as . . .

Speeds Get Higher, Problems Tougher

Two dramatic high-speed flights marked significant points in aeronautical engineering progress during 1958.

• **Faster than any research aircraft** had ever flown, the Bell X-1A socked Maj. Charles Yeager to a speed of Mach 2.5.
• **Faster than any military prototype** had ever flown, North American's YF-100 Super Sabre showed through sonic speed and into the supersonic range under the guidance of senior engineering test pilot George Welch.

These tremendous speed strides, made possible by teams of industry, military and government pilots and technicians, have highlighted three key areas underlying aircraft research and development today.

• **Drag reduction** is more important than ever. Very small changes in drag can be responsible for speed changes measured in hundreds of miles per hour.
• **Flight techniques** can make the difference. The Douglas Skyrocket reached Mach 3.85 under the capable hands of Bill Bridgman during the company's phase of the flight test program. After long study and accurate plotting of an optimum flight path and technique by a flight-test team, NACA's Scott Cross-

field took the same Skyrocket, unchanged, to Mach 2.01.

• **Wind-tunnel tests** can lead directly to tangible hardware. One big industry complaint in the past has been that NACA did only basic work, but as the design date it left something to be desired. Now, North American's F-100 design owes its reduced skin-friction, swept-back and low-mounted tail to research done in wind-tunnel tests at the National Advisory Committee for Aeronautics.

These are credits on the aeronautical ledger.

Problems

The debt column still has too many items to test most engineers and even

jets who keep watching the trend of development in the U. S.

• **Lateral stability.** One of the big problems is that expensive airplanes are missing out of lateral stability. The reason is an aerodynamic test. The shape of the air stream increases with increase in Mach number. This means that a given change in wing angle of attack produces a lot less lift at Mach 3 than it does at Mach 1.5. It's this wing lift—applied differentially with airspeed as by dihedral effect—that makes an airplane controllable as stable in roll. If that lift is not available, you find your self in the old performance first hypersonic experienced in Skyrocket flights where a wing dropped in supersonic flight and he couldn't pick it up with the elevators, couldn't turn, couldn't recover. He had to recover by using roll rate detectors.

• **Noises.** Another problem. What can be done about noise? This angle opens two processes to test areas in time and money that away of the costly problems of the past. It seems to be impossible to go fast, or to produce great amounts of power from moving air, without making an awful racket.

Military and civil aircraft alike are going to be increasingly aware about their business, and the prospect of jet transport is full on. Some experiments on Long Island Bay applied over activities.

Something has to be done. The plan set is that right now, nobody knows what to do. Further, nobody seems to know in which direction to go on order to find something to do.

So there are problems. If you want to talk aeronautical problems, the people to talk to are the scientists and engineers of the National Advisory Committee for Aeronautics.

NACA

Established by act of Congress in 1915, NACA has almost sole control over aeronautical research and experiments in this country.

• **To improve and direct the scientific study of the problems of flight with a view to their practical solution.**

• **To direct and conduct research and experiments in aeronautics.**

Today one big trend in NACA's laboratories is the integration of the airplane and its mission. Willyweilly, NACA is getting down into the system business. This was inevitable, be-

ENGINEERING

cause airplanes themselves have become part of systems, it was careful consideration from a systems viewpoint that enabled NACA planners to get more out of the Skyrocket when nobody felt there was any more to get.

With the conscious of systems study, the importance of the engineering test pilot increases. NACA's pilot staff has always accounted the ability to do much more than brace the controls around.

The old-time test pilot came back from a flight and reported the effect. Today's engineering test pilots report the cause as well as the effect.

Engine Integration—Now, then, ever before, the engine of any airplane has to be considered as part of a flow system that begins to intercept air well ahead of the engine, grips it in large quantities and exhausts it rapidly downstream. Every inch of the way, the moving air is doing something to the airplane or engine, and it is almost impossible to separate one effect from the other.

Part of NACA's present work in combustion engineering, the results will help improve high-altitude performance of our engines during the next few years.

Another area where much remains to be done is in structural design. NACA regards the design of structures as an ongoing task. Afterward, man has another step in addition to its engineering qualities if it is destructive to the structure.

There are two kinds of this work, reusable (which is most of the time) and non-reusable (which is the latter that tears the guts out of an other

honey, and one of NACA's big programs now is aimed at understanding the screws and doing something about it.

Configuration Studies—Generally NACA doesn't test specific design configurations. It studies broad stability studies of a delta wing, and the F-102 layout, it measures deflections of a swept wing, not the B-52 panel.

But NACA influence makes itself felt in airplane design. There are the three main control for the North American F-100—delta tip, delta, horizontal and low horizontal tail.

Wing tracery on the lines of leading edge extensions, fences, flaps and ribs have come out of tested tests at Langley and Ames.

One layout, which was evolved with the low horizontal tail as an answer to stability problems at high speeds, places the engine further off and lower than a normal one. So far no designers have picked this one up, but it's a safe bet that it won't be long now.

Now NACA's aircraft are very much concerned with the same problem. They got into it when they first started opening wind tunnels was inhibited wings, and they've been in the heart of the problem ever since.

Today there are several approaches looking for the attack on the same problem. Lewis laboratory continues its working with analytical approaches, they have the equipment because they promised to have a fresh approach.

These men formerly worked on aircraft flow studies, none of them previously had anything to do with either crash or fire studies. Their approach was fresh, their contributions large.

25 YEARS OF SIMULATED FLIGHT

The Link Trainer of yesterday pioneered the way for flight simulation on the ground. These developments and effective use in preparing the training of military and commercial airline pilots made "Link time" a requisite on each pilot's curriculum.

Modern flight training places even greater emphasis on simulated flight. New electronic jet simulators, such as Link's advanced F4D, F4E, and F4F, now being delivered to the United States Air Force, reflect the Link company's continuing leadership in the flight simulator field.

AND YET TO COME . . .

As the age of powered flight enters its third quarter of a century, and Link begins its second, this research laboratory of LINK is already at work to meet the military and commercial requirements of the forthcoming Age of Flight.

ENGINEERING

human habitat of technology, have contracts from NACA for analysis of sound. At the other extreme, NACA is giving for special sampling of some birds found in everyday life. NACA believes that if it can find out what kinds of noise are objectionable and why, it at least will have begun to define the problem.

Other Paddy-A look through the NACA's annual report—which is an unclassified summary of reports issued during the year—shows research trends in the number and kinds of research studies.

In tests of maximum lift coefficients, laminar flow at a speed which a decade ago was maximum speed for jets at supersonic. Now it is the leading speed for some.

Motorized propeller noise has been added as a parameter to the traditional form of propeller selection charts. You can select a prop for transport airplanes up to a flight Mach number of 0.8 and for an engine between 1,000 and 15,000 hp.

There is emphasis on fuel development to increase performance of the airplane by virtue of the chemical properties of the fuel.

Fuel thinking in wing tanks can be a help in reducing flutter or buff, if you can count on having the fuel there all the time. How much help will the fuel give? NACA has started to find out.

Aerodynamic heating may be a blessing or disaster, in some limited cases. For instance, it can keep a wing from icing. There are drawbacks: liquid water will run back and freeze anyway. So NACA has a technical note presenting a quick method for calculating the wing heat at altitudes up to 45,000 ft. and speeds to Mach 1.5.

Research Task 7,000—The latest parts of aerodynamic progress are claimed by the 7,000 technical and observational people who make up the NACA, and people in Washington headquarters and their own facilities.

• **Lowie Flight Propulsion Laboratory, Cleveland**—Here is, entire spectrum of high-propulsion is presented in high-altitude test cells and windtunnels, in static test stands and in shops.

• **Acron Aerodynamic Laboratory, Moffett Field, Calif.** Aerodynamic research is the job here. The world's largest windtunnel and some of the world's latest test stands are there.

• **Langley Aeronautical Laboratory, Langley Field, Va.** This is the "general problem" lab, where aerodynamics and structures, hydrodynamics and shops share the order of the day.

Thus there are two NACA substa-

■ ENGINEERING

off the Virginia coast, rocket-propelled model rockets skydived over the Atlantic in lightweight tests of wing shape, telemetry equipment, stability and control parameters.

At the Air Force Flight Test Center, Edwards AFB, Calif., the NACA has its hangar and testbed and flight crew.

These are research subcontracts that NACA lets out to specialized groups across the country to tackle some phase of work especially suited to their talent. Among them: Massachusetts Institute of Technology, California Institute of Technology, Benet Memorial Institute, Johns Hopkins University, the National Bureau of Standards.

In 1953, the Committee used about \$19 million of its appropriated funds, covering over an unbalanced balance of about \$8 million. The bulk of the money—about \$44.5 million—went directly into salaries and expenses of its laboratories, the subventions and the subcontracts.

► **Utility Plan**—Part of the NACA branch is to be operated under the so-called Utility Plan. This will start taking effect this year. Planning for the Utility scheme began in 1945 and stretched into 1947 in representation of government and industry met with three of NACA. They hammered out a proposal for a coordinated plan for warhead procurement.

The plan was considered, amended, cut down, and finally approved in Public Law 415 of the 80th Congress. It had started at a cost level of more than \$2 billion, comparable to the first atomic bomb cost. It was pared down finally to a group of appropriations totaling about \$500 million.

When the planning began, most major types of explosives were a little over 500 mph. Next year when the first fiscal starts moving on, the speed record will stand at more than three times that figure.

The NACA annual report has this to say about the problem: "The lack of mathematical methods for predicting theoretically aerodynamic behavior in the speed ranges of transonic aircraft means that this kind of information must be obtained through use of experimental techniques, the most satisfactory of which requires use of the large wind tunnel of the kind being provided under the Utility Windtunnel Plan."

"Before the end of 1954, the first of the Utility Plan supersonic wind-tunnel will be in fruitful use as a tool in the hands of America's producers of supersonic aircraft and missiles. The planning of a decade ago began not a decade too soon."

How the windshield panels

of Lockheed's Super Constellation are glazed with electrically-heated "NESA" Glass

A report from THE PITTSBURGH AIRCRAFT GLAZING FILE

These drawings show you a method of installing electrically-heated NESA coated Glass without the use of vitreously attached metal trimmer rings. They are details of the center windshield of Lockheed's 1649 Super Constellation, a plane with high-speed and high-altitude operations that make NESA Glass particularly suitable.

The NESA windshield used here consists of one piece of semi-tempered and one piece of full-tempered glass with a vinyl film between. Electrical current, carried by the NESA coating of the colored surface of the outboard glass, prevents ice formation and gives freedom from frost and fogging. NESA is also used as the adjoining flange glass areas, and the other four cockpit openings are glazed with Pittsburgh glass.

The vinyl surface is solvent to adhere flush mounting of the external trimmer ring. This method of installation permits the use of narrow parts that provide the least possible obstruction to vision. This best mounting assembly is engineered for maximum "double" safety as the vinyl film is capable of carrying flight loads and the preservation of 65 p.s.i. even though one or both pieces of glass were accidentally broken.

Working together, Lockheed engineers and Pittsburgh Plate Glass Company technical representatives designed the installation, and the same kind of technical assistance is available to you from Pittsburgh representatives. Your glass and glazing problems will be carefully considered in the light of one year of experience with the nation's major aircraft manufacturers. For complete information, write to Pittsburgh Plate Glass Company, Room 4384, 612 Fort Duquesne Boulevard, Pittsburgh 22, Pa.

A hand is shown holding a white, torn-edge tag. The tag contains the following text: "Electroizing" in a script font at the top, followed by "CASE HISTORY NUMBER 642" in a sans-serif font. Below that is "Aircraft Parts Manufacturer" in a large, bold, sans-serif font, then "Reduces Friction" in a slightly smaller bold sans-serif font, followed by "50%" in a very large bold sans-serif font, and finally "WITH Electroizing" at the bottom, where "Electroizing" is in a script font and underlined.

Electroizing
CASE HISTORY NUMBER 642
Aircraft Parts Manufacturer
Reduces Friction
50%
WITH *Electroizing*

The Problem: Serious friction problems were preventing the acceptance of a unit manufactured by a nationally known producer of aircraft equipment. Electrofining, chrome plating and other excellent surface treatments were tested without success. The treatments that reduced friction apparently failed to meet the corrosion specification. Those that provided the required corrosion resistance failed to reduce friction within the required limits.

How it was solved: Following a meeting held with the engineers responsible for the project, ELECTROLIZED parts were tested. Friction was reduced by 50% and the 100-hour salt spray requirement was met. Repetitive tests established the consistency of ELECTROLIZING to the satisfaction of the client.

tion of the authority responsible for the acceptance of the unit. ELECTROLYZING was incorporated in the drawing.

What it means to you: If you are searching for an answer to friction, wear, abrasion, or corrosion problems, **ELECTROLEZZING** is the ideal starting point.

At no cost and without sacrificing project time, you can quickly appreciate this process in terms of your own needs. Our 14-page booklet will help you. It describes some of the difficult engineering problems that have been solved with ELECTROPLAZING. Just return the coupon for your copy. There is no obligation.

Western Gear
EQUIPPED

The Northrop F-89 as well as the replica of the Wright Brothers' first airplane are both Western Gear equipped.

Whenever your aircraft mechanical power transmission problem may be, the "right" design in finished product is assured you when you draw on Western Gear's many years of experience. The aviation industry has depended upon Western Gear's engineers for the solution of their gear design problems for over three decades.

There is scarcely a military and commercial plant in use today — or on the drawing board for tomorrow — that doesn't use one or more Western Gear drives. Why not call us first?

AUTOPILOT SIMULATOR... consists of a complete control system work up. Flight conditions are simulated on the controls and output for response is recorded and evaluated. New features are constantly being introduced and added to meet demands of tomorrow's flight concepts.

Mogomps improve reliability, decrease weight . . .

The MAGAMP (magnetic amplifier)—a Westinghouse exclusive—is used to make the rate automatic pilot a new standard of dependability. As simple and reliable as iron and copper, MAGAMPs are rugged replacements for vacuum tubes. MAGAMPs operate directly from the ac supply voltage and require no filament current, hence have a greatly reduced cooling requirement. Greater component life is inherent in the transformer-like construction of MAGAMPs. Wherever used, they give systems added value with their reliability and long life.

These features make the Westinghouse rate automatic pilot far more dependable. Maintenance requirements are reduced, assembly is simplified and these full-time automatic flight control systems can be depended upon to perform under all types of operating conditions.

MAGAMPs and Potenti Units are two refinements developed by Air Arm to give electronic systems increased reliability and ease of maintenance. MAGAMPs are a Westinghouse development using specially wound cores, precision-cut and "Patented" magnetization to permit against all atmospheric variations, and improve heat dissipation and derating properties.

Air Arm facilities now producing rate automatic pilots . . .

Rate automatic pilots are being produced in quantity at the Westinghouse Air Arm Plant. The W-3 system—now flying in an Air Force all-weather interceptor—includes an ILS (instrument landing system) de-cet for

automatic, "hands-off" approach to a field in low visibility weather. Soon to come for the W-3 system is a radar de-cet, which means that the automatic pilot will take commands directly from the fire control system and automatically fly the interceptor on a computed intercept course . . . for what might be termed as automatic kill.

Airborne equipment must be as precise as a watch and as rugged as a steam roller. Fabricating such equipment and installing it in an airplane is not just a matter of taking measurements and waiting for a pattern—it requires real know-how and experience.

Today's answer for tomorrow's problem . . .

Experience has shown that in our business no problem ever stays solved. The requirement of building a better system is always with us. To meet the ever-increasing requirements of high-speed automatic flight, our development lab are at work, creating the advancements for tomorrow's flight systems. Thus, Air Arm is helping to bring Tomorrow's Aircraft . . . Out Right Now. Westinghouse Electric Corporation, Air Arm Division, Friendship International Airport, Baltimore, Md. 21106

Component of Westinghouse Rate-Type Autopilot is shown here being bench tested. This is part of the Air Arm program which guarantees that every unit will meet rigorous military specifications. Ability to produce and qualify complete systems under our own name means more defense for the defense dollar.

Only production automatic pilot to use rate gyros . . .

Modern, high-speed aircraft, because of aerodynamic requirements, often suffer from poorly damped natural oscillations—they are inherently unstable. The sensing elements which detect these oscillations and provide the "intelligence" to eliminate them is the rate gyroscopes. By developing a rate gyro and applying it to the E-9 and W-3 systems, Westinghouse has elevated the automatic pilot to the totally important tactical role of a completely automatic, integrated flight control system.

The rate gyro will not tumble, and provides instantaneous response to external disturbances and attitude changes. Using rate gyros in all three axes—roll, pitch, and yaw—Westinghouse rate automatic flight control systems can maneuver an aircraft quickly and smoothly, as well as provide "platform" stability.

These are the pilot's controls of the E-9 and W-3 Rate Automatic Pilots. Controls are lenses engineered to achieve simplicity of operation. The W-3A has provision for radar coupling and ILS (de-cet), making the autopilot serve a vital new role in automatic flight control.

THE SCOPE OF WESTINGHOUSE IN AVIATION

Air Propellers • Airframe Electronics • Aircraft Electrical Systems and Motors • Wind Tunnels to Rockets

YOU CAN BE SURE...IF IT'S
Westinghouse

ENGINEERS...our new brochure tells why

Westinghouse is a career...

The Air Arm Division offers a variety of challenging opportunities, available as a result of our long-range expansion program in the aviation-electronics field.

Many engineers are already building for themselves key positions in the organization that has produced some of the country's most advanced scientific developments. Career openings offer a variety of challenging problems requiring engineers with a high degree of originality and ingenuity. Excellent ground-floor opportunities exist for men from the B.S. to Ph.D. level.

A few of the many exceptional advantages of a career with Westinghouse. Professional recognition and industrial stability.

Opportunities, at company expense, for advanced degrees.

Exceedingly liberal patent disclosure compensation.

Salaries individually determined according to experience and ability.

Promotion on basis of individual merit.

LEAR VGI SYSTEM

...SIXTH SENSE

FOR THE BOEING B-47

In HIGH-SPEED manufacturing hazardous areas are introduced by conventional attitude indicating instruments. For greater safety, the jet plane needs something special in the way of an attitude indicator. For the Boeing B-47 and other jet bombers and fighters, this critical function is performed by the Lear Vertical Gyro Indicator System.

Operating as the plane's "sixth sense," the Lear VGI system is designed to measure and display deviation from horizontal flight with near-perfect accuracy and speed. All necessary gyros, amplifiers, and power supplies are contained in one compact unit which is remotely installed, transmitting pitch and roll intelligence electronically to the flight attitude indicator. The Lear VGI may also be used as a master vertical reference for an autopilot, radar, or other equipment.

Let us discuss your problems in instrumentation. We have been solving the tough ones for almost a quarter of a century.

LEAR INC. GRAND RAPIDS DIVISION

130 IDEAL AVE., N.W., GRAND RAPIDS 2, MICHIGAN

Executive Office: 2211 S. Bundy Dr., Los Angeles 26, California

LEAR VGI SYSTEM No-mechanical action gyro in roll, provides greatly improved accuracy, reduced wear errors. The system includes 2400 rpm gyro motor and a highly sensitive Lear electrolytic reaction switch.

SPECIAL

breaks a complex,
precision-bottleneck
in 'copter rotor assemblies

Few companies were willing to undertake this challenge to engineering, tooling, production and quality control. On the 12½" long, 12 lb hub above, for example, the two bottom threads and adjacent diameters must be held to a concentricity of .001 full indicator reading for a length of 2½ inches. Each component requires more than 60 separate operations. Few facilities are required throughout, ranging from 20 microns inches to a maximum of 100 microns inches.

SPECIAL

Machine Tool Engineering Works has been consistently able to produce these vital assembly components on schedule despite the close limits and tricky machining involved. . . . And Special's tight quality control standards are maintained at every stage.

That's why many of America's leading aircraft manufacturers and top firms in other industries look on SPECIAL as a part of their own plants. Why not find out how SPECIAL can fit into your production program?

SPECIAL

MACHINE TOOL ENGINEERING WORKS
134 Lafayette St., New York 13, N. Y.

Downloaded 2/10/16

Engineers make controls and testing an important aspect in test new designs.

On California desert, rocket engine flight reaching 3 times the speed of sound.

Shuttle engine tests using an engine rigging stand at an new experimental wing.

Even smaller wing design determined from the pressure of the supersonic wind.

Forwarded to study, rocket engine is recovered with film data used for the future.

SCIENCE CENTER — Future forms of flight are studied here in Lockheed's new Engineering and Science Building.

POWER PLANT REACTOR — Lockheed Superconducting, with radar ranges, particle flow and U.S.A.P. with new concepts of defense — a new method of detecting an enemy base in advance through applied electronics.

Missiles Era

Lockheed's rapidly-expanding Missile Systems Division is now probing new new, unexplored fields of electronics and pilotless aircraft, integrating 18 years of scientific research and practical application for a top secret group of vital importance to the U.S. This new Missile Systems Division is adding scientific personnel daily, speeding the conquest of outer space flight through space.

FIRST AUTOMATIC MISSILE — Adapted missile of Lockheed P-38, now known as U.S. Navy long range sub guided with electronic power and advanced radar system.

PERSONALITY — Men, Air Force No. 25, years from now, casually smile only by Lockheed, will continue new materials in advanced in world space. Here Lockheed men the clock X-ray film of new model.

Lockheed Scientists Shape the Forms of Future Flight

Lockheed's Expanding Science Center Improves Today's Planes and Develops New Designs for

the Era of Automatic Flight

FIRST IN THE NATION'S ALL-WEATHER DEFENSE — Lockheed F94 Skyraider is jet intercepter loaded with electronic for almost automatic flight. Skyraider proved that U.S. crew, even in darkness or bad weather. For 2 years, Lockheed has built more jets than any other manufacturer.

The above film strips take you behind the scenes to show Lockheed scientists testing new wing designs for future aircraft many times faster than today's. This is an example of advanced research at Lockheed's expanding Science Center. Scientists-engineers work with nuclear energy, pilotless aircraft, electronic systems, new materials for the era of automatic flight.

Lockheed's advances in pure science are matched by Lockheed progress in applied science. Lockheed's science of design has produced a roller-coaster team of pioneering military aircraft—flying radar stations, almost automatic interceptors, anti-submarine patrol bombers. Skill in science of production enables Lockheed to produce 22 different models simultaneously—and all models are on schedule!

POWER PLANT — Look for other dramatic new Lockheed models now, including X-100 Day Supersonic Fighter.

from Research through Production

Rhodes Lawn Company, a wholly-owned subsidiary of McCulloch Motors Corporation of Los Angeles, designs and produces specialized types of pressure-washers, pneumatic and electro-mechanical accessories for the military and for aircraft industries throughout the world.

But our capacities are not limited to these fields!

To meet constantly changing requirements, Rhodes Lewis maintains a sound, versatile facility—with equipment and personnel which are readily adaptable to the spreaded development and manufacture of similar equipment for other agencies.

As an integral part of its designing and manufacturing services, Rhodes Loran is also equipped to supply operations, overhaul and technical data, and to operate product training schools.

Some of the proteins-made products which Rhodes Lewis has developed, designed and manufactured

Military Aircraft Appropriations & Expenditures, 1935-1955

LOS ANGELES 45, CALIFORNIA

G.E. DEVELOPS 400-AMPERE GENERATOR TO MEET NEEDS OF NATION'S AIRLINES

A compact new 400 ampere generator requiring only six inches of cooling air runs a range of 4350-7600 rpm has been developed by General Electric to meet the needs of the nation's airlines.

First application of the new G-E generator is on the Douglas DC-7. All electric power aboard American's newest airliner is supplied by four of the new 30 inch, 400 amp G-E generators.

The new generator (Model SC31244) has the high est capacity of any wide-speed range commercial unit of its size (16 inch frame). Resulting from G-E's continuous effort in the requirements of commercial aviation, the new equipment offers three exclusive features:

- **QUICK ATTACH DETACH (QAD)** mounting flange permits installation in minutes instead of hours.
- **CLEARANCE TYPE SHAFT** absorbs engine drive vibrations and reduces vibration to assure longer life and reduced maintenance.

• **IMPROVED RING COMMUTATOR** permits higher speeds without commutator deterioration to provide greater service life.

• **WIND CORRECT SHIELD**, a patented advance in aircraft brush design, eliminates pre-heating of commutator, improves commutation, and reduces commutator temperature.

The new aircraft generator also offers three improvements:

1. Silver-plated, can-locus brush holder minimizes brush chatter and increases contact efficiency.
 2. Solid-steel armature binding brads securely hold end turns and prevent winding distortions.
 3. Pre-lubricated clearance type shaft (externally lubricated) provides for increased operating life.
- Whether your requirements are 100 or 400, a single generator, or complete electrical systems, contact your General Electric aviation specialist, or write Section 210-54, General Electric Company, Schenectady 5, New York.

Exclusive features of new G-E generator on DC-7

IMPROVED RING COMMUTATOR with silver-plated can-locus brush holder permits higher speeds without deterioration to assure long service life.

WIND CORRECT SHIELD eliminates pre-heating of commutator, improves commutation and reduces commutator temperature.

QUICK ATTACH DETACH mounting flange sharply reduces time required for generator removal or installation.

GENERAL  ELECTRIC

Airpower Balances on Budget Tightrope

Lean U.K. treasury forces government to hold down defense procurement, push export sales of military and civil aircraft. RAF receives first squadron of Swift F-1s, as B-47s and F-86s still man front lines.

By Nat McKitterick
(McGraw-Hill World News)

London—The breathing space in the East-West conflict which Sir Winston Churchill predicted more than a year ago has been a great boon to British aviation.

It has allowed Britain to follow a two-pronged policy on airpower development, compatible with the pressures living this country does not these days.

On the one hand, procurement of new aircraft by the Royal Air Force has been kept down—only \$350 million in fiscal 1953-54 and not much more in the up-coming year. Britain's air chiefs have deliberately postponed placing large orders for aircraft which promise to show marked improvement with each year.

On the other hand, a sizable proportion of Britain's airpower buildup has been turned into a commercial asset. Millions of Britain's finest civil jet transports have critical priority equal to the most important military aircraft projects. And exports of both civil and military aircraft are booming. Last year the British exported about 350,000 worth of aircraft, up from about 30,000 between civil and military types. At the same time, about 550 million worth of civil aircraft was delivered to British Overseas Airways Corp., British Overseas Airways and to the small fleets of Britain's private operators.

While these figures don't accurately describe the division of labor between military and civil work in the U.K. industry, it is significant that over half

the value of completed aircraft delivered last year was paid for by customers other than the RAF.

► **Good Economics, Poor Defense**—If this is satisfactory economics, nobody here claims it to be satisfactory defense. The front line of defense in the U.K. today is still manned by USAF-owned B-47 Stratojets and Canadian-built F-86 Sabres given to RAF Fighter Command over the past two years.

Military Aviation

Not until next month has RAF received its first home-built supersonic fighter squadron—Supermarine Swift V-1s. And despite the expected delivery of a small number of Vickers Valiant four-jet medium bombers this year, Britain's very promising strategic air arm won't reach its significant numbers before 1956.

The ultimate targets of the RAF, as set out three years ago when the current rearmament program was started, are still a long way away. When considering the program, the then Labor government's Air Minister, An-

AVRO VULCAN

thon Henderson, predicted that in fiscal 1954-55, for the first time, the RAF would outstrip the other British services in its claim on the annual defense budget.

But last year's defense outlays upset Henderson's prediction. This year's defense budget, which will be announced about the time that is printed, will again show the British Army getting more money than the RAF, and the British Navy not far behind.

► **Every U.S. "New Look"**—Undoubtedly, British leaders are not a little critical of the "new look" in U.S. defense policy which clearly establishes the USAF's prior claim on defense funds. Virtually all the arguments that led to the U.S. policy shift have been used here by irate British strategists for a long time.

Like the Pentagon, British military planners see the best defense against Russia today in terms of nuclear and devastating retaliation. Yet another way, the British don't yet see any re-

luctant technical defense against enemy missile strikes from the air. In World War II, US90 bombers—German V-1s and V-2s—fell on England. Now, almost 13 years later, the RAF would again have to rely on bombing heavily armed sites as the major means of countering even their first products of the missile age.

At the same time, Churchill, like President Eisenhower, is under the strongest sort of political pressure to keep defense spending within bounds. Indeed, only a Churchill could risk setting out a budget that year that would put a bit more for defense than last year's budget did. The increase reflected in this year's defense budget is not necessarily due to new spending on air development. It was made available by Britain's irrevocable commitments overseas.

Like the U.S., the British would dearly love to effect these economies by reducing their troop commitments overseas.

In the words of Earl Alexander of Tunis, Churchill's Defense Minister, "My aim is to build up a strategic reserve (in the U.K.) ready to go off to deal with any emergency at any time." Alexander spoke our month after President Eisenhower had virtually the same thing in the U.S.

► **Overseas Troops—Reducing** troop commitments overseas is the most critical to the development of the RAF than it is to the development of the USAF.

Today Britain has 15,000 troops in Malaya, 30,000 more in Korea, about two divisions in Germany, four armored divisions in Germany, and smaller units in such far-flung places as British Guiana, Gibraltar and Hong Kong. For a nation which is stretching its economic capabilities to find \$4.6 billion a year to spend on all defense needs, these commitments mean an enormous maintenance budget. In fact they mean that the British Army needs and gets more money than the RAF.

► **Research Budget**—These troop commit-

again put a few coddles on research presented for the RAF. Many areas, they carried spending on military research. No research figures as such are printed in Britain's defense budget, but the late Chester Millett, Britain's leading writer on military affairs (who died in the Comet crash last January), claimed that less than 10% of last year's defense budget was spent on research. Whittier figured "only a small proportion" of that 10% was spent on guided missiles.

This year spending will be shifted a little in the RAF's favor—and to the favor of research. But total sums of Britain's defense commitments are budgeted, in one form or other, the RAF's plans will continue to be hamstrung for lack of funds. The issue sits with Britain's diplomats and with the U.S. It is almost certain that the British will follow any U.S. lead in withdrawing troops from such places as Germany and Korea.

U.S. Air-While RAF development is held in check by Britain's economy, it is also supported to a great extent by U.S. aid.

Lackland, Neptune, Douglas Skywarden, and North American-Canadian Sabres have been given to the RAF and to the Royal Navy. Many of the Sabres, incidentally, are grounded in the U.S. for lack of a spare landing, often are in Germany.

More important, some 5463 million in U.S. money has been earmarked for direct financial help to the British aircraft industry over the past few years. That is a third again more than last year's total RAF budget for the procurement of new aircraft and engines. In one way or another, the RAF's whole production schedule is geared to this aid.

The U.S. has given the U.K. \$112 million in machine tools, without which the rather spectacular production program for the Rolls-Royce family of Avon jet engines would not have been possible. U.S. tools, the last of which are only now being delivered, are helping to turn out Avons in five different factories. In a tool factory, they are helping turn out *Avon*ing *Sidley* *Sidley* *Sidley* *Sidley*.

Then there is the "offshore" jet club program which has benefited Britain more than any other NATO power. So far, the U.S. has ordered 5147-eighth north of Hawker Hunter F1 in the U.K. and 5147-thirtieth north of Hawker in Holland (airframe) and Belgium (Rolls-Royce R.A. 7 engines).

To replace a shipment of Douglas Skywardens slated for the British but diverted, the U.S. last year spent \$113 million on Hawker Sea Hawk jets (Rolls-Royce Noels), now in squadron

Announcing...

- THE ONLY DOUBLE POLE SWITCH WITH EIGHT CONTACTS. Makes possible a wide variety of circuit combinations.
- THE ONLY DOUBLE-POLE SWITCH WITH SIMULTANEOUS "MAKE" AND "BREAK" ACTION. Reduces arcing, prolongs switch life, increases electrical capacity and permits unusual applications.
- THE SMALLEST DOUBLE-POLE SWITCH. Saves weight and space, allows more compact designs.

the new

ELECTRO SNAP

SIMULTANEOUS DOUBLE-POLE SWITCH

Look What You Can Do With It...

Control Four Circuits with ONE Snap

Used in motor control drives or ball valves where control is required at one pole only, the snap gives control to motor winding from the main line, but the motor is grounded to ground.

Wire Movable Poles in Series to Switch High Current or High Voltage

As proof of mechanical stress, you can connect the two movable poles in series to switch higher current or high voltage equipment and to increase number of contacts for high voltage switching.

Equip with Actuator

Push-button or remote actuator can be added for remote operation or for long distance control. Breaks a circuit in 1/1000th of a second or in 1/100th of a second. 100% D.C. Can operate in any position.

OTHER ELECTRO-SNAP PRECISION SWITCHES
Standard Switch, Push-Button, Remote Control, Industrial Line Switches, Remotely-Operated Switches

Start, Stop, Reverse Three-Phase Motors

Reversing three phase motors with one snap switch. Breaks or reverses current flow through the motor. Breaks or reverses current flow through the motor. Breaks or reverses current flow through the motor.

Elements Expensive Relays and Additional Switches in Many Applications

The double-pole switch often replaces a wide variety of expensive relays and switches. Use a snap switch in many applications where a relay or switch is required.

Season with the Best Move

Miss Inez Soule-Lair August, the British appointed Washington task force's agent. They asked for a 500,000 grant of some 5210 million, spread over two years, to make good the production commitments they have already made to NATO defense plans. At this writing, a decision about Washington is imminent. If the request is granted (and there is opposition in the Pentagon), much of the money will be administered as leather "collateral purchases" of Shuman or Glaxo Jovito doka-wang all weather fabrics.

Despite stories to the contrary, no decision has been made as to who will finally get the "effluents" Henters produced in the U.K. The U.S. takes

legal title to the aircraft when they leave off the production line in June 1955, or thereafter. Then the U.S. may affix its three-letter code.

Trying to plan ahead for RAF Fighter Command, the British are anxious to have a decision soon. It is certain they will get some of the aircraft, not all of them. That, of course, makes the whole "offset" business equal to a financial guess, something U.S. officials are afraid Congress will object to. But the fact is that its object is to increase Britain's defense contribution, and to that end the RAF needs many fighters.

The Norwegian west Hunsy and may get a few from the street. But only one other country could shoot are here numbers. That is Communist.

The idea of using Hunters to form the nucleus of a German air force is very much alive. The British were led to believe that many of the original Hunters, called "officers" in the U.K. would go to Germany. But the whole thing of German personnel being sent back since then.

► **What Our Money Buys**—Is this investment a good one?

Chances are this question is going to be faced pretty directly in Washington this year. Opponents of spending money on European aircraft production are likely to stress two points.

• Aircraft factories in Britain, as well as on the Continent, are vulnerable to Russian air attack. This argument is made to be used this year in NATO talks to top priority air decisions: the making of a NATO all-weather fighter. The question involves itself in a choice between the Glanville Jetstar and the F-56K. The British argue that it would be cheaper for the U.S. to finance a second Jetstar production line in the U.K. to supply NATO nations. They point to the huge expense involved now in assembling F-56Ks at East in Italy.

But other, more telling, political reasons make it highly likely that the U.S. will support the F-56K. Congress is likely to back more readily on the offshoot program of at least one U.S. aircraft is involved. And in Italy politics dictate keeping the Italian aircraft production force intact if possible. Right now Fiat has a small contract to assemble 50 North American-built F-56Ks. When an it will be followed with a large contract to build the aircraft completely at Fiat for NATO.

* One possible interpretation of the new U.S. defense policy would be that it is a signal to America's allies that the primary goal of policy would be to reduce the size of the U.S. military. The strategic goals and the mobile force would come from the U.S. In this context it is hard to build an American presence.

Either of these arguments, or both taken very far could cripple the hopes of the RAF, now so dependent on U.S. aid. Yet both the parties are purporting to ditch military assistance to day make it extremely unlikely that the U.S. will change its policy here.

First, the fact that the largest aircraft production base in the world is outside the U.S., exists and is growing is Britain today argues strongly that our investment is a good one.

Production

In 1999, more British aircraft reached

Thermostatic control valves, shown under test by TFA technology, controls oil supply to all cooler. (In addition, the possible sale of 21 additional Britannas to at least seven other airlines is under negotiation.)

70 Hudsons are flying on near flat light today.

All told the British aircraft industry, now 230,000 men strong, has been expanding at a 2,000-men-a-month clip annually, and most of the new recruits are production personnel.

New Development-Hawley to illustrate because of the security laws, and the new British air developments in the field which promise to make an original contribution to Western defense. Virtually no British aircraft, over the last few years have seen a few hours, and those few this year will see some more.

As one top RAF officer put it "We feel it is absolutely fundamental that we do our own strategic thinking."

There's no denying that among RAF planners today goes to Britain's three medium bombers, the delta-wing Avro Vulcan (four Bristol Olympus jets), the Hawley Page Victor (four Armstrong Siddeley Sapphire) and the Vickers Valiant (four R.R. Avon R.A. 14s). The shape, size, of the "Three V's" indicates an original approach to the problem of strategic bombing.

"Flexibility" is a word RAF policy makers use a lot these days. It applies with force to the three V's. Avro can take off from virtually any military airport in the Commonwealth. Indeed, that takes on more a primary consideration in their design (Aviation Week Oct. 19, 1953, p. 14).

Ranges are estimated between 5,000 and 7,000 miles. (Flight Refueling Ltd., equipment is being built into the Avro.) As long medium, using rocket, jet, and turbojet for propulsion, they make very promising nuclear bomb carriers. They inspired RAF Bomber Command's famous slogan, "A target, not a No. 100."

The Three V's—This year a second major concept, high on the list of RAF priorities, will come to light. RAF planners lately have been talking about offensively light defense capable of hitting enemy bombers over or near their home base. Armed with atomic armament, these intruders would, ideally, try to intercept enemy bombers as they return home.

First British aircraft with this mission promises to be the show stealer at Farnborough this year. Produced by English Electric, it is a sweeping bright light, smooth by which it is being carried out by the Short Bros. S.S. 3 experimental model with manually adjustable wings. The English Electric aircraft will have not much less than 70 day, sweep. Production version are likely to show English Electric's continued reliance on Rolls-Royce for engines.

Meanwhile Under Wings—When the dog of security life, Britain can be on

dependable subminiature indicator lights WITH WIDE-ANGLE VISIBILITY

Light "pops" through lens entire periphery of lens plastic lens occurs any visibility of signal from all angles

- ✓ Insulator, truly volumetric size
- ✓ Fully illuminated lens is clearly visible from any angle
- ✓ For either standard or adaptable standards
- ✓ Designed to meet all industrial and commercial standards

Larger illuminated area... smaller physical size

Smaller than most subminiature lamps, yet with unusually bright wide-angle visibility. Hetherington L4000 Series make ideal indicator or warning lights for critical military as well as many commercial applications. Using AN-1140 lamps fitted into a heavy plastic lens "pop" lens, these rugged lights are 1 1/2" diameter, and mount in a 1/2" base. Details on Bulletin L-2.

ported to have been to allow Westpac defense chain is the marine level. Both industry and RAF spokesmen have had observers here to look for an accord on one to as and as to general needs.

Because money is so tight, the RAF is almost extremely reluctant to make anything that promises radical improvement within a reasonable amount of time. Largely for this reason, British hasn't a single model in production today.

Minister of Supply Dennis Austin summed up the present situation this way last fall: "The first phase is the design and construction of prototypes. The second is the making out of trials and the introduction of such modifications in the trials show to be necessary. Thirdly, there is the manufacturing stage. It is the trials stage which we are now working with several rocket weapons." Trials are going on at Avonmouth's quiet Westons range.

►Boundary Layer Control—There are many other British military developments lying behind security. One avenue of study currently causing a lot of excitement here is in the U.S. is boundary layer control, or the use of jets in lift. In a speech last summer, Sir Frederick Handley Page, now in this direction a development "once more proposed to its effect than the introduction of metal aircraft in the 1930s."

"The introduction of jet propulsion," said Sir Frederick, "led to a new design philosophy which was at the margin of possibility and lift production." Large quantities of air, he pointed out, are available from the engine, which can be tapped to discharge some form of boundary layer or circulation control.

Sir Frederick claimed that basic research so far indicated that substantial improvements in performance, due to drag reduction or lift augmentation, can be obtained through bypassing of power to control the boundary layer or circulation, and hence the lift of the wing. "Alternatively," he concluded, "the whole problem of lift-off may be revolutionized by the incorporation of jet thrust into the lifting system."

Shortly after this speech, one of Britain's leading engine designers told members of the British aviation press that they should "pursue" the idea of exercising boundary layer control instead of spending money for more and bigger engines.

►Spending Trials Over—One of the brightest signs in British aviation is the fact that when, if not now, British up with companies spend some of their own money pursuing relatively research projects not undertaken by the government. Part of this spending is motivated by the fact that the competition

Equal performance at one-fourth the weight!

NEW AIRSEARCH OIL COOLER SAVES SEVENTY POUNDS OVER EARLY TYPE

AirResearch designed and produced the first lightweight heat transfer units for aircraft in 1939. Leadership in this field has been maintained by more than a half million hours of research and development, and by ongoing field experience—500,000 units produced and almost three hundred million operating hours.

The unrelenting effort to reduce weight and size and to improve performance continues. One result: this new oil cooler which weighs only 22.5 lbs. It is seventy pounds lighter than original units of equal capacity. AirResearch manufactures oil coolers which range from a capacity of below 100 BTU's to many thousand

BTU's per minute. These units—and all other AirResearch heat exchangers—excel in efficiency in relation to size and weight.

If you have a heat transfer problem which requires high performance and efficiency from a small, lightweight unit, consult our engineering-manufacturing team.

between companies for the very limited government financial money is so intense. By starting off on their own, the companies hope to get a jump on their neighbors.

• De Havilland focused its new Cyton jet through initial bench tests before the government stepped in with an order. The Cyton, now to be in the 20,000-lb.-class class, is a fighter engine, which will probably see the air first in a new Noval version of the DH. 110 all-weather fighter.

• Fieser Aviation, like a not atypical example, has sunk \$10 million of its own money into military research since the war, most of it on guided missiles and related work. And Fieser is a key company by American standards.

• Short Bros. last year focused primarily the Stanga research project, to test the possibilities of the synchronous wing form. (While 80% of Short's assets are owned by the government, only one director is a civil servant.)

• Folland. Probably Britain's most-advanced aviation capitalist today—in the military field anyway—is W. E. W. Petter, designer of the English Electric Canberra and now managing director of Folland Aircraft, Ltd., a big subcontractor to the industry. Petter is using his own money to build two prototypes, generally referred to as the P. O. 141 Gust. These are Britain's first light fighters. The first should fly in the fall.

The Gust's design goes right in only 6,000 lbs., but with it Petter promises to give a day-fighter performance in the class of the Hunter and Swifts. (Production Gusts will have a diameter wing three feet greater and are quoted as being designed for speeds to Mach 1.05.)

Based a building Petter on engine—the Olympus 5 of around 5,000 lb.-thrust. But the prototypes will fly on Armstrong Siddeley Viper jets of less than 1,000-lb. thrust.

Petter's big selling point is the Gust's low price—about £70,000 each on a quantity order. This is hardly a third of the cost of Hunter and Swifts. Petter thinks this is the answer to the problem of making defense and companies agree in western Europe. He has presented his case strongly to NATO officials in Paris.

Though committed to Swifts and Hunter, RAF top brass has turned a deaf ear to Petter's arguments for the Gust so far.

What is Petter sacrificing to get his performance at that weight, the RAF wonders. After all, Hawker Hunter designer Sydney Camm secured weight savings in the Hunter to the limit of his ability—so much so that he had plenty of headaches finding enough

WHAT'S NEW AT BRISTOL...

High-precision diaphragms set new standards for accuracy, repeatability, and uniformity

• Bristol's new air-welded diaphragms of extremely thin (0.003" to 0.007") stainless steel, Ni-Span C, and phosphor bronze are now available for pressure transducers, pressure elements, and seals for many applications in the automotive and aircraft industries.

The result of 45 years of experience in the manufacture and application of hundreds of thousands of pressure measuring instruments, Bristol's diaphragms give uniformly accurate performance under low and high temperature conditions.

The accuracy, repeatability and uniformity of these pressure-sensitive diaphragms are made possible by Bristol's specially developed air welding equipment, laboratory controlled heat treating and annealing processes and the use of the latest leak detection equipment. You can get the diaphragms for pressures of down 1" water pressure, full travel up to 150 psi. Write for more information to The Bristol Company, 136 Bristol Road, Waterbury 20, Conn.

Bendix jet ignition systems...

streamlined for
maximum efficiency!

Although jet ignition is a comparatively new development in the
80+ year span of powered flight, progress in this vital phase of
systems has been truly remarkable.

Unlike spark plugs for reciprocating engines, which have re-
mained relatively constant, jet ignition has gone through several
major design changes within the last few years.

For example, a comparison of the TLN-10 jet ignition system,
produced by the Scintilla Division of Bendix, with earlier designs
shows significant improvements in every operating characteristic
—and at the same time compact size, operating expense and weight
are substantially reduced.

Here, indeed, is the Scintilla TLN-10 jet ignition system, a
classic example of how the present national policy of greater value
for the taxpayer's dollar is being put into practice.

Valve Talk

for Wm. R. WHITTAKER CO., Ltd.

By Marvin Miles,
Senior Engineer, Aviation Writers Assn.

There's chemistry in an aircraft valve—a fact I hadn't considered until the other day when I talked with Luke Hilder.

I say "talked with" Luke. Actually, he did all the talking and I listened. So, with your permission, I'll try merely to summarize the points made by this tall, five-year Whittaker specialist, a U.S.A. graduate and formerly a Lockheed engineer.

"Agreed," he said, "is no better than an ordinary link, and in the case of aircraft valves that link can be the seal of a complete 10" long. Unlike it's of the best quality, the seal just won't function as a seal."

"You see," he explained, "the complexity of systems, valves must only be as simple as possible. World War II New fuel specifications, with increased temperature requirements, gave engineers a rough task, for they developed a high valve steel in various parts. This actually defeated Whittaker design, and we searched for relief."

"Finally we went into rubber compounds, rubber compounds and together with the Whittaker Rubber Company achieved the actual improved source of AP-714 C rings with the desired reduction in cost."

"We had improvements and some fuels continued to give us trouble until we studied the actual material. Value, which is evaluated by the Rockwell hardness test, and the hardness of the metal and the hardness of the metal. There were no improvements, however, for we found Teflon did not fit in the actual hardness of rubber nor it did have an inherent yield characteristic."

"Through analysis and research we came up with the answer—epoxy. And the result is a compound and design that-type used to overcome the equipment and solve the characteristic. This innovation yields benefits in our new fuel designs."

Luke pointed next to the subject of lubrication, always a problem in mechanical design, especially when you're dealing with a variety of fuels and an extreme temperature range. He pointed out that Whittaker was among the first to use dry film lubrication successfully—the new fuel was secured and baked on to give a tough, durable surface.

"As fuel is used, through these dry lubricants we were able to change them from ordinary valves with a maximum and minimum of 200 degrees F. to steel interfaces with an even temperature that added up to 1200 degrees. At the same time we saved weight, too."

"But bearings gave trouble," he continued, "and the outside link

appeared to be 150 degrees. Here, too, Whittaker researchers have found that with the proper use of special metals, shaft bearings will hold up under 1000 degrees heat and operate without and smoothly without undue lubrication."

Temperature also brought problems in lubricating process, with engine parts designed and valves designed without lubrication with certain combinations.

"Then we discovered," Luke mentioned matter of factly, "that for an aircraft gear train, a mixture of special grease with silicone oil improved both lubricity and temperature range beyond the capability of other lubricant oils."

In passing, Luke also disclosed that Whittaker composed the hard materials proven so quickly that the company was the first manufacturer on the West Coast to be licensed by MIL-STD-883C for the Whittaker Rubber Flange Test Device.

With time, working along similar lines, Whittaker, and had that metal plate aluminum in order to achieve the same level of performance. We were even experimenting with the aluminum metal process."

So far I had managed to understand at least part of what Luke was saying, but then he went into technical details and the size of plants, "to control galvanic and electrolytic corrosion."

"This is an important part in the quality and performance of our product," he said, "and that through development and jump up with all the new materials and processes as the product."

"Another right one used in making valves, epoxy and phenolic adhesives are used. Nylon, Formica, Vynyl, Teflon and Delrin are more of the new synthetics we have discovered. Teflon has been used in valves for some of the previous metals and in our products."

That's it, and the progress is continually improving aircraft valves—and for maintaining the performance of the engine.

■ BRITAIN

turboprop Viscount, stole the show last year and is likely to do so for most of the year. So far, 56 Viscounts, worth over three \$1 million, have been sold. Vickers has delivered 10 to British European Airways and six to Air France. BEEA has 10 more Viscount 700s ordered and Air France six more. Between them these two operators will have Viscounts operating into every European capital and many Middle East centers this year.

Air Lingua will have six three Viscounts ordered, and will operate these between Dublin and London and from Dublin to Manchester, and Amsterdam. By 1961, Trans-Australia Airways will have Viscounts running Down Under on tertiary services. And perhaps before the end of the year, the Trans Canada Air Lines will have the last of their 15 Viscounts flying into New York.

Early this year Vickers will commence delivery of the Viscount 602, a design which BEEA has ordered. The 602 is a revision of the 501 which BEEA ordered just a year ago. With the same gross weight (56 to 62 passengers) and the same gross weight (15,500 lb.), the Viscount 602 is designed for economical operation up to 900 miles, whereas the 501 was a specialized aircraft designed for high-density, 500 mile stage lengths. The greater flexibility in cost per ton-mile of the 602 over the 501 is made possible by the fact that Rolls-Royce has continued to find both new power and new economies in the Dart turbo-prop.

Darts now are giving 1,400 shp. plus 500 lb. of thrust for BEEA in service. In their first six months of operation with BEEA, Viscount 700s showed a cost per capacity-ton-mile of about 45 U.S. cents. Already Vickers has announced new versions of the Dart with 975 shp. and fuel consumption and 81% increase in speed. By the time the 802s get flying, the Dart should show even more economy and power—boosting up from the present 350-plus mph. cruising speed to about 390 mph as the 802s.

De Havilland Canada—in contrast to the Viscount, the past year has been the year of the trouble for the de Havilland Canada. Orders for Series 2 and Series 3 Canards moved up very little over the year, in contrast to what to see what would have to be done in the result of crashes with the Canard 11.

Although accidents with the Canard 11 at Rome and Karachi have led to a redesigned landing edge on the Canards 2 and 3, in order to give more lift on takeoff.

BOAC has introduced 50 merchant

the man from Esso... the refueling crew man

This is Frank in Joe, Jack or Clarence and his fellow Esso crew men around the world in an important role in the aviation industry. The quality of their services and of the products they deliver is backed by more than half a century of world leadership in the research and development of aviation petroleum products.

Esso refueling crew members are trained specialists who are proud of their jobs. They know that safe and efficient servicing means better service for the aircraft. Operators of leading-line airlines rely on Esso. Esso's reputation for aviation high quality of fuels, lubricants and greases along the airways of the world.

Airlines... 8 out of 10 use

Land-Air PUTS MISSILES UNDER A MICROSCOPE

Tracking a missile that knifes its way into the atmosphere and beyond at speeds faster than 3000 miles per hour is more than following it with a pair of high-power binoculars or radar eyes.

Photos are needed. Its course, speed, temperature of the air around it, air pressure, etc. friction . . . space position indicators. This information must be collated with ground information to provide a true and accurate picture of missile performance.

Projects like this require special instrumentation and development research in the microwave, optical and electronics field, both ground and airborne. This is the special field of Land-Air's Instrument and Electronics Division at Alamogordo, New Mexico. In recent projects, this research involved an improved radar, servo-operated tracking cameras, new and accurate time-signal generators, wave-lane and radar signal filters, sequence choice radar, and complete instrumentation networks.

The Land-Air teams that produced these results are available for subcontract development and research work on your project. Their available experience and techniques have wide application in the field of missiles.

Write for this booklet describing Land-Air services now, or, better yet, call our main office. A Land-Air engineer-representative will call on you at your request.

■ BRITAIN

oil modifications in the Comet 1, most of which will be incorporated in the Comets 2 and 3. Both operator and manufacturer are equally as anxious in having these modifications.

But still unanswered at this writing are the causes of the two major BOAC Comet 1 disasters near Calcutta last May and off the coast of Elba in January. Both of these terrible incidents during climb for reasons which are still shrouded in mystery. Questions are bound to persist in such points as the adequacy of the Comet's fully power-operated controls or the behavior of laminar flow under certain conditions of temperature and pressure. Probably only accident-free hours in service will ultimately restore full confidence in the Comet.

Following its policy of pushing production and introducing modifications on the line, DEB has moved ahead with both the Series 2 and the Series 3 Comets. The Series 2, with four Rolls-Royce Avon Mk.152 jets giving speeds of 7,000 m.p.h. sheet, has almost completed its initial flight tests. To show its stuff, the Comet 2 prototype in January made a nonstop flight from London to Khartoum. The figure was impressive. Distances, 3,500 miles, average speed, 451 m.p.h., payload, 10,500 lb. equivalent (passenger) fuel load, 6,900 gal. DEB test pilot John Cunningham landed at Khartoum with 1,110 gal. of fuel left. The sheet range of the Comet 2 is about 2,600 miles.

Then comes the eagerly awaited Comet 3 prototype (four Rolls-Royce Avon B.A. 35 jets of 5,300-lb. thrust) will make its first flight. One reason was the Comet 3's main advance is boosting capacity from 44 passengers in the Comet 2 to 58 passengers.

► Reverse Throat-But there will be some technical changes. Most in increasing will be the Handley's reverse throat mechanism designed to get extra lifting to the 148,000 lb. Comet 3.

Changes are the mechanism will appear on one of the first three Comet 3s, but not on the prototype. It has been described as widening after the fashion of an oval, closing off the tail of the propeller, and directing the airflow through guide vanes in a generally downward and forward direction.

De Havilland is the strongest of Britain's aircraft builders financially. The company has virtually ruled its future on Comets. It would be a great mistake to believe that who didn't predict that the Comet will move this year with a vengeance.

In any case, civil jet operators yearn for it and every nation which they will never have to say for the knowledge BOAC and de Havilland are

Launched Lightning!

Into the wind, into the dawn—with a scream and a trailing plume of flame—launched "lightning" takes to the sky. Today's jets on the flight deck and tomorrow's, still on the drawing boards, all must meet extraordinary performance standards. Every part is critical! Leading aircraft manufacturers know this and consider Lavelle their most reliable subcontractor for the fabrication of stainless steel and aluminum aircraft components.

Lavelle

LAVELLE AIRCRAFT CORPORATION, NEWTOWN, DUKES COUNTY, PA.

■ BRITAIN

RAF's newest turboprop engine, an engine in the 4,000-hp range. The Victor 900 design hasn't been fixed up, as far as is known. RSA, which is interested, wants a high wing configuration, but that depends on selling the idea to other potential customers.

■ **Based on Turbo-prop-Diesel at Bristol.** Dr. Stanley Hooker, head of Bristol's Engine Division, scoffs at those who see no future in a big turboprop engine, mentioning the 10,000-hp Bristol Olympus turboprop, a new rival for Olympus with his current Proteus turboprops to produce an 8,000-hp turboprop destined for the second generation of Britannias. He gives 24,000-hp for 30-mph. head-on speed, but claims the great economies of the turboprop will make up for that. The Olympus plus Proteus turboprop will actually be rated less than 4,000-hp to give Hooker the slack to offer constant power from sea level to 25,000 ft.

As for competitors, Hooker claims that will go with time. He says that nothing like the money spent on researching turboprops has been devoted to researching turboprops. By 1975, when Hooker's new engine should be flying, he thinks turboprops will be a lot simpler.

■ **Concorde Successor—Nothing is known of de Havilland's thinking about Concorde's successor other than the fact that a design—or rather design—cost. According to sales manager Frank Lloyd, DH will base its sales argument on a belief that there is and will be a place for "Concorde" in heavy transport. That will be the place for the absolutely most expensive turboprop.**

From the merger date released on DH's powerful Cyron turboprop, it seems the company is getting simplicity and efficiency in turboprop design in the forefront. If turboprop economies can be made competitive, the Cyron or its derivatives may be the engine to watch.

If the pace of turboprop development in the U.K. is to be maintained, money must be found to keep all these projects alive. DH alone is saying now that it will use its own money to build a "Concorde" prototype.

BOAC will probably underwrite the Britannia development of the first Britannia turn out as well as they promise. And if stability is to play any part in RAF thinking, money must eventually be poured in the development of RAF Transport Command. Besides ordering the V-1000 prototype, RAF Transport Command has ordered only one new type of aircraft—10 Blackburn & Consett Bentley lighters.

DC-3 Replacements

In a recent key, several British companies this year will be testing pursuit

control— when you need it!

Coming out of a power dive is a modern jet fighter tests the skill of our finest pilots. These men must be able to count on the ready response of sensitive controls. For that matter, controls must be dependable at all times—for takeoffs and landings as well as precision maneuvers in the air. That's why so many of these craft are equipped with Saginaw

Ball Bearing Screw assemblies. Saginaw Screws can be supplied in a complete range of load and life requirements. They can be equipped with electrical, hydraulic or pneumatic units to operate retractable landing gears, ailerons, trim tabs, wing

flaps and many other vital aircraft parts. Write

today for our free engineering

data book.

Saginaw Screws are the heavy used to improve performance in many products, inside the belt of aviation. To name a few: field production on double head grinding and heavy duty control gear wheel lathes, control mechanisms, hydraulic and electric actuators in the Army automobile and adjustment and power steering.

vehicles designed to do the work of the unobtainable DC-3. Despite a forecast of pessimism about the market for DC-3 "supplacemats," British makers are going ahead with prototypes. They cite India and Africa as places for a new aircraft with limited capacity.

• **Hawley Page**, with its HPR-3, is farthest along. Two prototypes are building. The HPR-3 is a piston engined aircraft-powered with four Alvis Leonides Major. It will carry three tons, or 35-44 passengers, 1,500 miles at 210 mph.

• **Aston**, Tynes, Ltd., a large sub-contractor, is entering the field with an *Aeromaster*, powered by two Rolls Royce Dart turboprops. The *Aeromaster* will have a maximum payload of 6,600 lb., six tons at around 310 mph for 910 miles. The aircraft is so arranged as to be able to carry 15 stretcher cases with attendants, 31 passengers, or two tons or equivalent freight. Prototype has just started.

Helicopters

Hamer has it—and a well founded rumor it appears to be—that the three British services this year will finally place a quantity order (200 or so) for a British helicopter. If so, the only logical contender is the Bristol 173.

• **Bristol**—The 173 is a 16 passenger copter with a stall air range of 214 miles and a cruising speed of 133 mph. Its gross weight of 13,100 lb. is lifted by two three-bladed rotors powered by two Alvis Leonides Major engines. To achieve loads on the rotors during forward flight two sets of stub wings are mounted dam and aft on the fuselage.

The 173 this year went through extensive tests on an aircraft carrier of the Royal Navy. At the time, its use as an anti-submarine weapon was suggested. British Aerospace Airways is using a few 173s to transport its airspeed telemetry plane in the U.K.

• **Falvey**—Most interesting Bellknap research project in the U.K. is the Falvey Rotodyne jet. Still two years away from first flight, the Rotodyne will be the first to carry Britain's tourist tradition into the helicopter field. The prototype, underwritten by the Ministry of Supply, will be designed for 40 passengers and baggage and a cruising speed

HOW TO KICK OFF A ROCKET in the right direction

...and FORD
was asked to find
the answer

Load! Aim! Launch! And off goes a rocket from shipboard... but not without precise devices that start the rocket in the right direction. Devices such as Ford Instruments has manufactured for the Armed Forces since 1943. For from the vast engineering and production facilities of the Ford Instrument Company, come the mechanical, hydraulic, electro-mechanical, magnetic and electronic instruments that bring us our "unobtainable" today. Control problems of both industry and the Military are Ford specialties.

You can see why a job with Ford Instrument often means engineering challenges. If you are quality, there may be a spot for you in automatic control development of Ford. Write the brochure about products to job opportunities. State your preference.

is *Expected*

CHANDLER-EVANS

Working in close cooperation with leading aircraft engine manufacturers, Chandler-Evans has developed fuel supply and regulation systems that have made possible many of the important "firsts" in aviation history.

Today, "CECO" developments are already proving the way to tomorrow's goals of still higher, faster flight.

The acknowledged superiority of "CECO" can make extraordinary performance a practical reality. Write us our address.

CHANDLER-EVANS
DIVISION HILTI RESEARCH FUND COMPANY
WEST HARTFORD 1, CONN., U.S.A.

■ BRITAIN

around 170 mph. It will be powered by two Napier Eland turboprops. Pavey is already thinking in terms of 60 mph dragons and cruising speeds up to 300 mph. He produces revenue. An interim project, the Gyrodyne, incorporating the Rotodyne's rotorhead, will fly shortly.

• **Westland.** Westland, with the Sikorskies license in the U.K., is building 3550 for the RAF and the British Army this year for the first time with British engines—Alco Lambda Majors.

• **Saunders Roe** is marketing the little Sirocco helicopter, developed from Cleve, Ltd., patents.

• **Pavey** has a helicopter project, called the F74, designed to apply a gas generator to helicopter propulsion.

Naval Aviation

The Royal Navy this year will probably show off two new fighters:

• **Vickers Supermarine** Division soon should announce first flight of the production version of the Vickers S6B twin Avon fighter which appeared at Farnborough two years ago. Orders for the supersonic fighter have been placed.

• **Appearance of the D.H. 116** in naval settings at Farnborough last year bypassed all the latest developments of that all-weather fighter. DH is building some 110 prototypes with folding wings. Speculation has it that the production version will use the Cirrus turbojet.

Last year the Navy's 17 months tender, the *Shearwater*, made its first appearance—17 months from design conception to first flight. Powered by an Armstrong Siddeley Marlin (it may have a Bristol Marlin ancestor), the *Shearwater* is the forerunner of "light fighters" to come. It is designed for hunter-killer operations with NATO escort carriers. Because of its cheap construction, *Shearwater* has high export hopes for the *Shearwater* among NATO nations. Price more than \$140,000.

So far the Royal Navy has had less than good luck with its aircraft. Only last year did the *Westland Weymouth* fighter get into service, its Armstrong Siddeley Pythia turboprop having given great trouble with engine. No more than 50 were built. The RN's first jets, the *Vickers Attacker*, are already being supplanted with the very clock but straight-winged *Harrier* Sea Hawks.

And the Navy's superpriority anti submarine aircraft, the *Percy Gossett*, too have, cruising and cruising and now say for months and months and months. This year, it is confidently predicted, the *Gossett* will move in service about two years late. Half a dozen or more production models of the double Marlin-powered fighters are flying now.

75%

of all the helicopters
flying today have

Franklin engines power 4 out of the 5 CAA certificated helicopters under 400 h. p. — Bell, Hiller, Sikorsky and McCulloch. The production of these four manufacturers in the under 400 h. p. category has accounted for 75% or more of all the helicopters in the world, all powered by Franklin engines made by Aircooled Motors, Inc.

**Aircooled Motors is also
a major subcontractor of
precision machining**

The same men and plant responsible for the extraordinary success of Franklin helicopter engines can accept additional subcontract work similar to that long produced for major companies in the aircraft field. We are fully equipped for quantity production of precision machining and sub-assemblies of the highest quality. Your inquiries are invited.

Offshore Buying Props Ailing French Industry

By Ross MacIntyre
(McGraw-Hill World News)

Paris—The French Air Force is fast going into a major slump in the defense of Western Europe. But this has not brought paucity to French plane builders. On the contrary the aircraft construction industry has posted some warnings of troubles it may well affect the whole future of French aviation.

The buildup of the French Air Force during the last three years has been accomplished largely with American equipment delivered under the U. S. aid program. French industry has played a relatively minor role, and the industry's great problem today is simply lack of orders.

More than a year ago France launched a long-term program to replace American equipment in the FAF with planes designed and built in France. The U. S. has contributed importantly to this program with an \$86-million offshore procurement order for Nord's Dassault's Mirage interceptor but still the replacement program is proving a costly burden on the often financial resources of the state.

■ Budget Gap—Plane builders say the Ministry orders the aircraft are too small and too subject to revision, postponement or cancellation to give the industry a chance of operating efficiently—or even maintaining its present facilities. Government officials say that France has a chronically unbalanced budget and simply can't devote more funds to aircraft construction.

This gap between what the govern-

SENFORS 1400 GERFAUT

DASSAULT MYSTERE IV

ment can afford and what the aircraft industry needs is the basic problem of French aviation.

Industry Potential

The French aircraft industry employs some 63,000 workers—33,000 in air-

frame construction, 16,000 in engine plants and 14,000 in auxiliary equipment. Manpower by the numbers of workers employed, about two-thirds of the aerospace and engine industries is concentrated.

If all the manufacturing facilities of the industry were fully utilized, it is esti-

THE NIGHT BEFORE THE PROXY FIGHT

Harrison Wells settled himself in the comfortable seat of the company's new-overhauled plane—the company's plane, he selected his company, too, for that matter. He had built it, at the first, by single-handed effort. Now, he was flying home to do battle for its control.

This year, a new group of stockholders was challenging him. The show-down was set for tomorrow—10 A.M. in the company's board room. Harrison Wells gazed the clock side of his brief case. He thought of the next pack of proxies he had rounded up in a hurried, cross-country tour of some 5,000 miles.

Make him the chairman of the board—kick him upstairs? Not this year! The plane flew steadily eastward.

Flights of this kind can be quickly planned and safely completed if orders are correctly checked by Airwork. The personalized service and the engine exchange program offered by this national organization make possible faster-than performance for the privately-owned plane. Nowhere else, except in the shape of large, scheduled air lines, will you find such production-line techniques, equal to those of the original manufacturer.

Ask any of Airwork's 21 Class A dealers about their overhaul and supply services. You can depend on their ability and integrity.

■ FRANCE

stated that France could produce 1,200 to 1,400 fighter planes—like the Mystere or the F86—each year. The industry claims it must have orders for 600 to 800 planes annually to achieve mass-production efficiency. Projects are not built that more than half that mass-production level of production can be attained.

André Ben Little-Courmoultur has not to date been repeated victim of French planes. A recent report showed that 21 European airlines owned a total of 615 planes. Of this total 58% were American, 20% were British and only 4% were French—12 four-engine, C-54s; four three-engine, C-47s; three four-engine, C-54s; and 10 three-engine, C-47s.

French airlines are just now picking up some of the new orders. Air France has signed a contract to buy 24 Nord-Dominion H.D. 32s, a two-engine plane with a high-speed take-off, which is just now getting into production. Industry officials hope some foreign carriers, too, will place orders for the H.D. 32.

The French Air Force is new, and will equip for at least the next few years, the one big buyer of French-built planes. But FAF's capacity to buy is strictly limited by the general political and economic conditions which shape the national budget, and a close look at the present structure and organization of the FAF gives little reason for optimism.

French Air Force

About 1,000 planes of all types now serve the colors of the French Air Force. The French have about 500 planes in Indochina including four transport squadrons with DC-3s, the fighter squadrons with Republics, two light bomber squadrons with B-26s and one reconnaissance squadron.

In Europe and North Africa, France has a total of 38 squadrons equipped with F4s, Mustangs, Corsairs and various Mustangs. French version of Mustang (Vampire). All but eight of these squadrons are pledged to NATO and operate under the command of Allied Air Forces Central Europe.

■ \$400 Million to Spend...To re-equip and maintain this force the Air Ministry this year has a budget of \$300 million (\$77 billion francs). Of this total about one-third, \$250 million, is for aircraft construction and is being spent principally for the production of four planes—the Mystere IV, Suez Vautour, Nord 2501, Fagat Magister. ■ Mystere IV, equipped with a Vautour engine (Hapson-Suez version of the Tui) developing 7,700 lb. thrust, will begin to go into squadron service in September of this year. The Vautour

HAPPY LANDINGS!

Next time you fasten your safety belt for a landing... watch for that fragile moment when the big plane stops being airborne and shifts its weight from wings to wheels. That's the moment when Ostco heavy-wall tubing goes to work...supplying strength-without-weight to such vital parts as axles, shock absorbers and landing gear. If your aircraft product requires seamless tubing, formed or fabricated, send us your blueprints for prompt quotation. Latest edition of Ostco A-2 Handbook in years upon request.

■ FRANCE

engine later will be replaced by an actual
Fiat Air 100C built by the national
company SNECMA. This engine will
develop about 7,300 lb. thrust and an
afterburner will add about 20%. The
costs of the plane is about the Navy
TVB and is expected to go into
service in about two years.

• **Vautour.** The 1954 budget also
provides funds for the construction of TV
SNECMA Vautour, a two-engine ground
support plane. The Vautour will have
Fiat 100B engines with 5,285 lb.
thrust, which give it enough speed to
crack through the same barrier as a
shallow dive. The first Vautour will
begin to go into squadron service about
the middle of 1955. The present Vau-
tour order is considered only a first step
and will be supplemented with funds
to be provided in future budgets. The
French also hope the Vautour will at-
tract attention abroad. They point out
that within the NATO air forces only
the American B-26 and the British Can-
berra are designed for light bombing
and ground support missions of the type
the Vautour will specialize in.

• **Nad 2901.** The third plane in pro-
duction is the Nad 2901, a two-engine
transport. The Air Ministry has placed
a new order for 60 of these planes. Pro-
duction of this plane is now six or seven
months, and the first of them will be-
gin to go into squadron service within
a few months.

The French believe the Nad 2901
is particularly well-suited for use as a
tactical transport in Indo China. It can
carry seven tons over distances less than
500 miles, and its configuration makes
it suitable for dropping heavy loads by
parachute.

• **Magister.** A fourth plane, the Pange
Magister, will go into production this
year. The Magister is an advanced
trainer powered by two Turbomeca
Machet engines with 550 hp thrust. A
total of 100 of these planes have been
ordered and deliveries will begin in
about 18 months.

• **New Candidates.** Two other French
military planes—the Brasseur and the
Trident—now are in the testing stage,
have shown promise and may be pro-
duced with next year's funds.

• **The SNECMA Brasseur,** powered by
an Air 100C with 6,165 lb. thrust,
takes off with rocket assist from a turbo-
jet sled carriage and lands on skids.
Tests so far have given better than ex-
pected results. The Brasseur can land
on ordinary paved ground, on a sandy
beach or in grass. A pre-production
version of the plane has been ordered.

• **The SNECMA Trident** is the other
plane being tested. The Trident is a
very light plane designed for the de-
posal of small critical items. It is po-
wered by two Turbomeca Machet en-

planes with 880 lb thrust each, and covers test vehicles which are expected to reach top speed by March 1-5. The plane probably will make its first flight with rocket power next spring.

The Future

These planes are the newest weapons in the arsenal of French aerospace. With the funds available to them, French aerospace giant they now being these new planes into service at the rate of about 500 a year. That is about all the nation's economy will allow, and it also shows all that is needed to make the FAL at its present level.

But this figure represents only one third of one-fourth of the present production capacity of the French aircraft construction industry. So unless exports and sales to French airlines can be greatly increased, the industry is in for sad times which will force reorganization of the nationalized companies and a big reduction in industry capacity.

► **Three Phase Down**—First steps in the demobilization already have been taken. Within the last six months there are no more aircraft plants have been closed permanently. Since war started to close two of its six factories, and Marquardt shut down one plant.

The industry, naturally, is doing its best to resist this trend. With government support it has organized a committee to study foreign markets, arrange exhibitions of French planes abroad and advise French manufacturers on export sales techniques. It also is using larger appropriations for aircraft construction and the expansion of some facilities on purchase of foreign planes by French airlines.

But none here at the industry is there are great optimism that these efforts can succeed fully enough to solve the problem. The U.S. government could solve the problem in various ways, such as offering procurement orders and supplying French planes to other Allied nations.

► **Solution is EDC**—The brightest hope for the future of the French aircraft industry, with the proposed European Defense Community. If the EDC treaty should be ratified this spring, the French believe it will open to them a big and profitable new market. Of the six EDC nations—France, Germany, Italy, Belgium, the Netherlands and Luxembourg—only France has in existence now a big, skilled and equipped aircraft construction industry.

To French aviation it will be better known if considerable opposition to EDC in the French national assembly is overcome in 1956 the treaty and its studies the blow that may well knock out half the industry's present capacity.

**CONTROL TOWERS AND CONSOLES
COMMUNICATIONS SYSTEMS
for AIR TRAFFIC CONTROL**

TYPE T-2 PORTABLE AIRPORT CONTROL TOWER

A complete airport control tower, transportable by helicopter or truck. Includes radiotelephone transmitting and receiving equipment, aerological instruments, and provisions for field telephone. Control facilities for two operators. Air conditioning and heater.

APPLICATION. For permanent or emergency use. Set up and operated anywhere—within minutes. Maintains aerological communications, and controls available field lighting equipment.

Write for illustrated brochure.

COMMUNICATIONS CONTROL SYSTEMS

Wickes is a pioneer in the field of integrated communications control systems for airport use. A wide variety of consoles are manufactured, to provide radiotelephone transmitting and receiving facilities, aerological indicators, field lighting control and facsimile display, interphone communication, crash-alarm signaling message recording control facilities, and flight progress data.

CUSTOM-BUILT CABINETS

Cabinets to house your equipment designed and built to your specifications. Let our experience solve your cabinet problems.

Wickes will design and build to your order complete communications systems for air traffic control. Your inquiries are invited.

Canada Rushes Defense Net, Aids NATO

Lion's share of defense funds goes to RCAF expansion in Canada and abroad; aircraft and engine production is small but growing.

Toronto—Largest slice of Canadian defense expenditures in the past few years has been for the Royal Canadian Air Force.

Results of this policy are now visible with a number of RCAF squadrons on active duty at bases in Great Britain, France and West Germany, with progress being made on the Canadian continental defense system, establishment of first domestically based Canadian jet fighter squadrons, and completion of a number of large training and supply bases across Canada.

Industrially the results of the policy are also noticeable with jet aircraft and engines coming off assembly lines at plants in western Canada and new jet aircraft being ordered.

RCAF

Although few details have been released, the RCAF reports progress in the past year on the early warning and ground control system for continental defense. Some of the units were in operation late in 1972, and construction work on other units was completed at end of 1973. Radar systems in operation mostly by RCAF and U.S. air services throughout northern Canada.

Canada is also planning to develop a new system of radar warning developed at McGill University, a system which is cheaper in manpower and equipment than the conventional radar warning system now shared with U.S.

RCAF during the past year opened ground observer (GRO) units across Canada, as part of its continental defense establishment. First Canadian-based jet fighter squadrons using the Canadian-made and -designed CF-180 two-seater jet fighter were established in 1973 at North Bay, Ontario, along with a training base for crews for these aircraft. A number of other Canadian bases are being equipped with CF-180 aircraft.

Continuation to NATO-Oceania, Canada now has 12 Suber-equipped squadrons, based at Llangan and North Lufkinham in England, at Malta and Viterbo in France, and at Zwickau and Baden-Siedingen in Western Germany. These are part of Canada's contribution to NATO. Canadian air staff officers include both men and women. Primarily all aircraft used in the overseas operations were flown over during 1973.

Canadian air forces took part in a number of operations with the USAF in north Atlantic and northern Canadian areas during the past year, particu-

lar the joint operations. The RCAF also developed its coastal squadron, its transport service, and its search and rescue groups, it took delivery in 1973 of two British de Havilland Canada jet transports for its Transport Command, the first Canucks to be used on this continent.

Base and Non-Nuclear arms have been built to stand during the past year as part of RCAF's 500-million construction program. These included two large supply and overhaul bases outside Toronto and Edmonton, as well as permanent buildings for personnel and new hangars for large aircraft. Resources were extended at main airports for jet fighters, and training bases were completed.

The first 1-33 Silver Star jet trainers made in Canada by Canadian Ltd Montreal, were delivered to training bases. Arrow trainers from main coast lines are now undergoing training at Canadian bases, Portugal and Italy.

CANADIAN T-33A SILVER STARS

New Fenwal Overheat Detectors Guard Eastern's New Super-C Constellations

3. WINTER TO SQUARE in three hours and help drive machines in a "temporarily scheduled" test of Eastern Air Lines' new Super-C Constellation in New York-Miami run. The new Super-C Constellation is the first used in heavy travel and depends heavily on Fenwal Overheat Detectors as a new "high-angle" fire and overheat detector for the aircraft in protection on this blue-ribbon transport.

2. CASE OF INSTALLATION in a change of all Fenwal Overheat Detectors shown, is a two-terminal, horizontally sealed unit being installed on Eastern Air Lines' latest transport. Many of America's leading aircraft operators have standardized on Fenwal Detectors after extensive tests and experience to serve environmental and operational conditions.

3. X-RAY INSPECTION is used in many tests for quality-control and accuracy to which individual components are subjected at Fenwal Laboratories. Fenwal engineers conduct and patients analyze non-destructive methods which are making Fenwal temperature control and detection devices preferred throughout industry for the dual qualities of absolute dependability and reasonable price.

4. HERE THEY ARE Fenwal two-terminal Overheat Detectors in two designs — with permanent disconnection. The right-hand model is developed for use in engine compartments — temperature-sensitive agent used in the standard version, except a control switch is located in the engine compartment as a master alarm point. They comply fully with CAA and RAE requirements for complete duty, with Fenwal Incorporated, 122 Pleasant Street, Ashford, Massachusetts.

Bendix DIGITAL DIFFERENTIAL ANALYZER

MODEL B 12

HIGH SPEED • ACCURATE • MODERATELY PRICED

Mathematical versatility and simplicity of operation are the noteworthy features of the Bendix Model B-12 Electronic Computer.

The Digital Differential Analyzer will solve the most complicated engineering problems quickly and precisely. The digital numbering system is used exclusively in both programming and data and machine calculations. Operators are easily and quickly trained.

Model B-12 is the ideal machine for the solution of complex problems in the fields of hydrodynamics, optics, chemistry and analytical mechanics.

The Bendix Computer gives you high speed controlled versatility for:

1. Linear and non-linear differential equations
2. Simultaneous sets of such equations
3. Integral equations
4. Differential matrix problems
5. Inventory or substitution sets of linear or non-linear equations and differential equations
6. Substantial simulation of two- or three-phased phenomena

■ CANADA

air transport joining those of Great Britain, Norway, Denmark, the Netherlands, Belgium, France and Italy in 1953.

As part of its continental defense plans, RCAF this past year began training personnel in ground defense in one of paratroop or other enemy attacks on local airfields.

Recruiting was reported in continuing steadily throughout 1953. Estimated strength at end of 1953 was 41,000 officers and men, about 5,000 more than at end of 1952.

Production

At 1953 ended the Canadian government announced plans for new orders for new aircraft being placed with Canadian aircraft manufacturers, thus making the decision to keep the Canadian aircraft manufacturing industry in active operation. Canadian aircraft plants during 1953 made aircraft not only for the Canadian military services, but also for those of the U.S. and other members of the North Atlantic Treaty Organization.

► **5400 Military Service Aircraft**—The aircraft manufacturing industry in 1953 accounted for about three-quarters of the entire revenue from aviation in Canada.

In 1952, aviation ranked ninth among Canadian industries, and last year set a new maximum record amounting to about 5400 million. Of this, over 5300 million was accounted for by manufacturers of aircraft and components, and repair and overhaul services, according to estimates of the Air Industries and Transport Act, of Canada.

Half of the \$300 million revenue was for defense work, including payments on contracts totaling \$704 million in 1952.

► **New Plans**—At year-end the government announced plans to produce a new jet fighter, the CF-105, by A. V. Roe Canada Ltd. This delta-wing aircraft is expected to have a speed of 1,280 mph, a range of 1,500 mi., to be armed with rocket missiles, and to have two new jet engines to be made by A. V. Roe Canada. A prototype is to be ready by about end of 1955.

The other new plane to be produced is the Grumman SIF anti-submarine aircraft, which will be made under license in Canada by the Royal Canadian Air Force of Canada, Ltd., mainly for the Royal Canadian Navy. Orders are expected to be placed for 100 of this aircraft to start, with 150 more at a later date, according to unofficial estimates. Started for early production in Canada is the British Bizek Beform for

Kittell-Lacy Silencers

completely eliminate jet engine noise problems!

Stop neighborhood complaints...improve personnel efficiency and morale!

Kittell-Lacy Silencers reduce the ear-shattering noise accompanying ground testing of jet engines to an acceptable level. Operation is so quiet tests can be conducted day and night without complaints from surrounding residential areas. Operating personnel benefit, too, since reducing the noise level safeguards hearing, lessens fatigue, and increases efficiency!

Put Kittell-Lacy's experience to work for you!

Kittell-Lacy engineers, specialists in acoustics and structural engineering, were pioneers in developing sound abatement facilities specifically for silencing jet engines. They have designed, fabricated and installed some of the largest silencers now in use. Many of these are in continuous operation at extremely high temperatures, yet have required no maintenance other than routine exterior painting.

If you want to know more about Kittell-Lacy facilities and experience, a new informative brochure is yours for the asking. Write for it today.

Dynamic silencing silencer on the T-37 D-10. Kittell-Lacy silencers provide easy installation of noise on jet aircraft.

60 years of heavy steel fabrication experience! Kittell-Lacy's extensive manufacturing facilities and personnel experience in fabrication and installation of heavy steel structures assure good construction.

Third International AVIATION TRADE SHOW

May 5, 6, 7, 1954

71st Regiment Armory
Park Avenue at 34th St.
New York City

Aviation today is a twenty-billion dollar industry, demanding machinery, tools, metals, electronics, electrical devices, fuel, lubricants, handling equipment, packaging, plastics . . . virtually every product produced by modern industry.

THE MOST EFFECTIVE
SINGLE MEANS OF PLACING
YOUR PRODUCT AND
YOUR COMPANY BEFORE
THIS VITAL INDUSTRY IS
PARTICIPATION IN THE
THIRD INTERNATIONAL
AVIATION TRADE SHOW.

The only business show in this great industry, the annual International Aviation Trade Show brings to you the key personnel of aviation. It enables you to meet personally the engineers, production and purchasing men who make the decisions. It affords you the opportunity to introduce new products, strengthen your sales efforts, increase your volume.

For details and tickets, write

CANADAIR F8E SABRES

RCAF. This is to be made by Canadair, Ltd., with certain modifications from the commercial Britannia made in Great Britain, including, it is said, a new wing, elongated main fuselage, redesigned tail assembly and use of U. S. built Wright engines. A prototype will probably be built this year, with an order for 50 of the aircraft expected initially.

► **Manufacturing.** Linpac-Canada's aviation manufacturing industry is still small. Your company are building aircraft, those are making engines, and about a dozen are the principal overhaul and component manufacturing firms in the country. There are several licensed transfer companies and plants whose main business is not the aviation industry, making components and parts for the manufacturing plants.

Most of the industry is centered in western and central Canada, and is controlled by British or American parent companies.

• **A. V. Roe Canada, Ltd.**, is located at Malton, Ontario, a suburb of Toronto, and has about 10,000 people working in the aircraft plant, another 5,000 in

an engine plant. Currently, two is building the CF-100 Mark 4 for the RCAF in undisclosed numbers, as well as the Otway jet engine for both the CF-100 and the Sabre F8E being built at Canadair. Oden have been completed on the CF-100 Mark 3, which has been equipped with rocket nozzles.

Research work is being done at the plant on advanced type aircraft, including what is believed to be a "flying saucer" type of gyroscopic powered single seater fighter. No official information is available on this research job which is very hush-hush at the plant and at government circles.

Work is also progressing on new jet engines to power the new delta wing CF-105, while production of the Otway engine is on schedule. No figures have at this time been released as to production of the Otway engine since the early stages of its production.

• **De Havilland**, at Downsview, another suburb of Toronto, is continuing with production of its single-engine Beaver and Otter aircraft. The Beaver was used by the U. S. in Korea and other

Where's "Charlie"?

The "bird" will find him!

As it probes along at supersonic speeds—high above the earth—its guidance system directs it unerringly to target "Charlie."

Electronics makes today's accurate missile guidance a reality—and electronics in the past, present and future of RCA.

For years, RCA has been working with the Armed Forces on design and

engineering of more accurate, more effective missile-guidance systems. The same RCA engineering facilities—from original planning to final production stages—are available for development of complete electronic systems of all kinds. AMPHENOL

miniature

165 Series

The new AMPHENOL 165 series miniature AN-type connectors average about the weight of standard ANs but retain the major features initiated by AMPHENOL in the larger connectors. The 165 series are the latest AMPHENOL contribution to the continuing program of miniaturization of components for instrumentation.

Quick

microphone connectors

AMPHENOL QUICK Microphone Connectors are the newest, the most efficient and certainly the most attractive connectors ever offered for audio applications. They are available in 3 or 4 contacts and feature tough construction equipped with fine materials. Contacts are plated with gold or chrome finished brass.

ALJAK cable

ALJAK coaxial cable has been designed by AMPHENOL to permit a wider scope to cable applications in critical electronic equipment. Waterproof and semi-flexible, ALJAK is made with a tough aluminum jacket over extruded Teflon or polyethylene dielectric. The cable has very low attenuation as well as a smaller o.d. than equivalent RG type cables.

lockheed on the L-20. In the fiscal 1953, ending last Sept. 30, the company delivered 181 Brewers and 16 Oscars, the latter for the RCAF. A total of 533 Brewers had been sold since the company began production of this piston-engine Canadian fighter. It is now being used in 23 different countries, including the British Islands where the 500th aircraft is on an

Most of the Brewers are equipped with Pratt & Whitney engines, but for sterling currency countries a new Brewer was produced in 1953 powered with the British Alou Lincoln engine. Sales for 1953 totaled about \$15 million.

De Havilland Aircraft of Canada also sells and services the Bristol de Havilland Dove trainers, the de Havilland Comet jet airliners, the de Havilland Comet jet engines which power the Comet, and operates a number of RCAF aircraft and the General Electric T-57 jet engine.

•Canadian, Ltd., is the major aircraft plant at Montreal. American-owned, Canadian is building the Silver F-606 and the T-33 Silver Star jet trainers. It is reported that about 1,000 Silver Stars were produced by late 1953 for Canada, Great Britain and the U.S.

Delicate engines for combat aircraft are being sought, but none are at present known to be headed for production. The company serves and overhalls the North Star DC-6V, with which it started piston production for the RCAF and Trans-Canada Air Lines. While piston plans are for possible production of the Bristol Britannia under license for the RCAF as a transport, there is likelihood that this aircraft may also be produced for civilian purposes at this plant.

•Pratt & Whitney and Rolls-Royce at Montreal are building aircraft engines for the Harvard trainer, and Rolls-Royce is building four turbojet engines for the T-33 jet trainer.

•Canadian, Ltd. and Canadair, at Fort William, Ontario, at western end of Lake Superior, is completing an order for Harvard trainers, and was building components for the T-36 trainer when that order was canceled in the latter part of 1953. It may start production of another trainer for the U.S. government next.

These are the major aircraft and engine manufacturing plants in Canada. Together they employ about 31,000 people, and form the nucleus for a large aircraft manufacturing industry in Canada.

ONLY GILFILLAN HAS PROVEN GAP-FILLER RADAR NOW

This example is only one of the many instances of the remarkable 4-year dependability record of perfected Gilfillan Surveillance Radar when combined with outstanding maintenance by CAA personnel at major U.S. airports.

Reliable air defense requires reliable radar. Gilfillan is the only gap-filler radar now available that has already made the long jump from prototype to proven performance. Gilfillan has developed and delivered more ground surveillance radar than all other manufacturers. The proven dependability of this perfected equipment is now demonstrating itself—at this moment and 24 hours every day—at more than 200 air bases and airports around the world.

IF HOURS WERE MILES

During the entire year of 1953, GILFILLAN Surveillance Radar was on guard 24 hours a day, 365 days a year—at Boston International Airport with only 7½ hours of involuntary outage. This is less than 1/20 of 24 hours were radar, this would be the equivalent of the short distance from Boston to Los Angeles. (Boston Airport compared) at the vast stretch of air miles lying between Los Angeles, Boston and New York.

REGULAR OR KING SIZE?

These Aerojet-General solid-propellant rocket motors represent the solution to a multitude of propulsion problems. Ranging in size from 350 to 33,000 pounds thrust, they were developed and produced by Aerojet-General to fulfill the needs for assisted-takeoff of piloted aircraft, for a source of standby power, for propelling high-speed test sleds, and for high-thrust, short-duration boosters for sounding rockets and missiles. Most-produced at Aerojet-General's 8400-acre site near Azusa, California, these rocket motors are another indication of the tremendous advancement made in the field of rocket power by the nation's leading rocket research, development and manufacturing company.

■ CANADA

On tourist services, imaginative new domestic and international routes and began all-cargo and all-freight services with specially built cargo airlines. In 1953 Canadian airlines expanded their operations both at home and internationally and waged a major battle to break governmental monopoly of certain domestic air services.

■ **New and Private-Rate** governments-owned and privately owned airlines will have new and better aircraft in use in 1954.

■ **Trans-Canada Air Lines**, government-owned airline, is starting new daily transcontinental service later this year with Lockheed Super Constellation, eight of which have been ordered. Some of them will be used in TCA's trans-Atlantic service which now runs Canada-wide North Star DC-6M aircraft in transatlantic service.

TCA will also take delivery later this year of the first British Vickers Viscount turboprop aircraft to be used on the Montreal-Toronto service, Montreal-Toronto service to New York, Toronto service to Cleveland and Chicago.

For cargo service, TCA early this year began using British Bristol Freighters, three of which were ordered. Air cargo rates were reduced by 10% at beginning of 1954.

■ **Canadian Pacific Airlines**, which in 1953 began its Vancouver-Moscow-Leningrad service with DC-6M aircraft, now has a 12,000-lb. service in operation from Hong Kong via Tokyo to Leningrad, as well as service from Australia to Vancouver. Late this year it will take delivery of the first 66 Hamilton Gnat 2 jet airplanes to be used by a North American carrier. These have been ordered at cost of about \$4.5 million for use on the long-range ultralightweight routes, Honolulu to Vancouver, Vancouver-Moscow City-Leningrad. A fourth Gnat 2 is to be delivered in 1955.

During 1953, CPA applied for an all-cargo service from Montreal-Toronto on northern Manitoba to Vancouver, but was turned down.

■ **Other Services**—The government also had a number of applications for expansion of regional university passenger scheduled services by mail carriers towards the end of 1953. Decisions are pending, and will have an effect on further expansion of Canadian airline operations. Some of the carriers also asked for permission to operate tourist services. TCA began descriptive tourist air service in February of this year.

An increasing number of U.S. non-scheduled charter air services were licensed by the Canadian Air Transport Board for operations into areas through

out Canada. Many of these operations will carry passengers and freight for mining and exploration companies, as well as tourist traffic.

The Canadian government plans to remove with U.S. civil aviation authorities the opening of more international routes between the two countries to two classes, one from each country. In addition to such new routes, TCA will open a number of new domestic services in 1954.

■ **Good Year**—Canadian airlines had a good year in 1953.

During the last half, the latest period for which complete figures are available, Canadian airlines flew 433,

408,000 revenue passenger-miles and 5,928,000 revenue ton-miles.

Canadian Pacific Airlines in the first 10 months of 1953 carried 197,000 revenue passengers, flew a total of 7,703,300 miles, flew 138,400 revenue passenger-miles, and 1,528,530 revenue-ton-miles, in addition to 560,000 mail ton-miles.

Trans-Canada Air Lines in 1953 carried 1,900,000 revenue passengers, a new record, and a total of 10,000,000 revenue miles on domestic and international routes. TCA in 1953 flew 6,000,000 aircraft ton-miles, 1,630,000 in revenue ton-miles, and 3,366,000 mail ton-miles.

■ FOREIGN AIRPOWER

Airpower in Japan

Plenty of Talk.

Not Much Action

By Alphonse W. Jenson
(McGraw-Hill World News)

Tokyo—Talking airpower, at Japan's expense at the start of 1954, has taken up lots of subject, endowment, plans and dreams in the aircraft industry, but practically no physical progress.

The single exception is the rapidly developing Japan Air Lines Co., which has completed 27 months of scheduled domestic operations, and last month began scheduled international operations. The exception was American equipment in the air and on the ground. Military support has been delayed, and war loss of the armed forces of last year. The aircraft industry has suffered accordingly, although defense and enthusiasm have brought about construction of the major general aircraft producers. Until they have a real market, however, little can be expected. And the market can only come from military requirements in the part of the world.

■ Air Planning Group—Not until last fall was an air planning group created within the National Safety Board (Japan's equivalent of the Department of Defense). This group has just been encouraged by Prime Minister Yoshida's announcement that it will soon become the Third (or Air Force) Staff. Further encouragement comes from a provision in the new budget for the fiscal year beginning April 1 of \$1 billion yen (\$20 million) for this year, the first draft provision.

The planning group acts as its first target the making of an inventory group. The USAF has permitted the assistance of an American advisory team which will begin working with the Japanese at Hansonville Air Base in April. The initial staff to be used will be the North American T-64 (on loan from the Far East Air Force), and B-26C T-34s in part of which will be purchased out of budget funds and part to come from local sources. The plan is to hope that some T-64s may be made available, but they have been advised that the shortage of this aircraft probably makes this impossible.

Later in the year, possibly around January 1955, the planning group between some pilots will be ready for transition into the Lockheed T-33. Again it hopes there can be made available by FEAF.

The alternative to loan from USAF and FEAF could come from the Mo-

■ FOREIGN AIRPOWER

tail Security Agency. As yet, little is known about what the equipment split will be in MSA and for Japan. On the one side, no one has indicated whether the aid will be in items which would encourage Japanese production of aircraft or simply in the form of equipment produced elsewhere and delivered to Japanese forces.

■ **Industry's Role**—The Japanese industry has had its hopes partially dashed with the recent signing of a contract between Lockheed and Kawasaki Aircraft Co. for the manufacture of F-94 Starfighter interceptors and T-33 trainers.

Kawasaki also will repair and maintain jet engines under a deal being worked out by Lockheed and Allison Div. of General Motors.

There is no doubt that the Far East Air Force desires such an arrangement, and that it would welcome a similar one with North American to build the Sabers in Japan. North American has a tentative agreement with Shin Mitsubishi Heavy Industry Co.

The question asked here is how one can expect a sound defense base in Japan or elsewhere in the Far East without some production in the area. None of the Fifth U.S. Army MDAAP countries (Korea, Formosa, Philippines, Indo China and Thailand), can undertake such manufacturing for years to come.

■ **"No War" Clause**—The Japanese are concerned that they may be led down a no-war clause to disavow by power U. S. pressure with regard to Japan's defense future. In the last about the "no war" clause, which Gen. MacArthur wrote into the constitution which he still prepared for Japan, stated an ideal situation for an ideal world in which Japan might live. The people by and large welcomed this after the long hardships of wartime austerity and the destruction which U. S. airpower wrought through the ruins either of the home islands.

Since 1950, U. S. authorities have sought revocation of the effect of this clause. That policy has been domestically concerned with ground forces and limited contingents of naval forces. Currently, Ambassador Allison must press for Japanese government acceptance of the U. S. desire for a 345,000 man defense force, primarily foot-soldiers. There isn't a ghost of a chance that the Japanese will accept this goal.

Japanese with some conception of the strategic position of Japan are convinced that a 345,000 man infantry force is going to defend Japan; not is a 3,345,000 man infantry force. They are sure that well over two million men under arms were unable to defend the home islands from defeat in World War II.

Also, they refer to the seven straits

ANY MILITARY LOAD ANYWHERE by FLYING BOXCAR

Only airplanes designed and built from stem to stern to handle big bulk military loads is the C-119 "Flying Boxcar". Fully equipped troops, gear, ammunition, mail—building machinery, helicopters... these and countless other types of bulk military loads are shipped to every part of the world at an impressively low cost per ton mile delivered in the Flying Boxcar C-119.

Designed especially to load, fly and unload big bulky cargoes, the "Flying Boxcar" is flying everywhere in the service of America's Armed Forces and those of the United Nations.

In production now, the C-119 delivers heavy military loads.

For the coming American jet age, the C-119 Jet Transport

FULL PERFORMANCE with half the weight, half the size. ONYX-1000 miniature length (only 1.5 inch) is more than 10 times that of the "SUB-MINIATURIZED" accelerometer—greater sensitivity, superior precision, automatic correction (limited) yet developed accuracy, its most exclusive performance spans 20 g's (dynamic).

APPLICATIONS—vibration, shock, impact, pressure, acceleration, displacement, velocity, position, etc. ONYX-1000 is a "SUB-MINIATURIZED" accelerometer—greater sensitivity, superior precision, automatic correction (limited) yet developed accuracy, its most exclusive performance spans 20 g's (dynamic).

FOREIGN AIRPOWER

tion of Great Britain at the start of World War II. Germany's armoured rifleman Europe to the English Channel with little trouble, but were unable to invade England because the RAF was able to gain control of the air over the Channel and over Britain.

► **Defense Phases**—Top planners in the National Safety Board told Aviation Week that there are two phases to Japan's defense.

► **Defense in the air**
► **Convey defense on the sea**, to bring in safely the food Japan needs.

They state that only a defense of the air over the Sea of Japan can protect Japan. They are sure that the major threat—Russia—controls a large, modern jet air force which partly encircles Japan.

Physical lag in superior development stems from the failure, Gen. Mas-Araki is to include a provision for air forces within the original National Police Reserve which was established in the fall of 1950. He included ground and maritime units only. Gen. Mas-Araki in SCAP was not concerned with the Korea situation to pay much attention to the Japanese problem.

► **Gen. Clark's Role**—Things seemed up when Gen. Mark Clark took over as far east commander from Ridgway. Gen. Clark apparently wanted to win the battle over Amer control of tactical aviation which he had lost in Washington since October 1951. He pushed upon the Japanese, under Japan the inclusion of limited aviation which he hoped would be expanded into Japan's air-controlled air force. Reliable accounts in the Far East Command Headquarters told Aviation Week that Clark, against orders from Washington that he was to take Gen. O. P. Weyand, Far East Air Force commander and operate an office in the Far East, to all discussion with Japanese authorities on aviation aviation.

Some army officers have passed the word that Japan's airport at force in the main aviation rule operation in the National Safety Corps. There has attracted many first line Japanese pilots, but solely because it provided the only flying available in Japan. It has one of the equipment nor use of the tactical doctrine necessary to defend Japan in the air against a Communist air attack. It is simply an arm aviation system capable of providing air-battle support and air support.

Currently, there has been an official change in the U. S. position. Far East still is placed upon ground forces. One was asked "Are we in one big battle against the U. S.?"

► **Policy Decision**—Informed U. S. officials

RYAN builds ROCKET MOTORS for 3000 mile-per-hour missiles

It takes a motor powerful enough to propel a missile at speeds exceeding 3000 mph... so powerful that its developed thrust can propel to tens of thousands of pounds. One of Ryan's most challenging current assignments is the complete production of such a motor for an Army Guided Missile surface-to-surface missile.

There was a tricky-old problem of fabricating, welding and machining that Ryan had to solve in connection with rocket motor manufacture. Because a rocket motor is capable of burning as much as a ton of fuel a minute at temperatures up to 3000 degrees F., terrific internal pressures are created that must be contained in a very compact package of complex construction and exacting dimensions.

The solution was found in perfecting new techniques for fabricating, welding and machining the special

alloy materials. Ryan devised new methods of controlling work to very close tolerances, rigorous electric resistance and arc welding processes and a better furnace heating system—gas atmosphere machine operation—used to be given life to precision.

Ryan's ground ability in the production of complete rocket motors is due to large amounts to its long experience in building the "hot end" of jet and piston engines. Its versatility in many specialized fields is an important advantage in such new assignment, for it enables every division to draw on 31 years of first hand experience in the most advanced phases of aviation engineering and production.

Thus, each year more unique technical engineering and production projects are awarded Ryan... an integral and completely self-sufficient division in meeting the challenges of today's high-speed air age.

■ FOREIGN AIRPOWER

aviers say that apparently only a National Security Council decision could get the Japan air program underway and that so far there isn't the slightest indication that any decision is about to be made.

The two important policy decisions are:

- Can Japan shift its emphasis from ground forces to air forces?
- Will Japanese industry be encouraged with USA assistance and aid in order to create a necessary industrial support base in this part of the world?

The former need of the Japanese National Safety Board planners is a 1,300-plus air force, including 500 to 600 jets, mostly F-86s and F-94s with the necessary complement of T-7s. No bombers are included in these programs. Other requirements include some transports and anti-sub patrol craft, as well as light trainers and liaison aircraft. Numbers are stipulated at this time.

The hope is that all types will eventually be built in Japan, but they are not counting on production at this time. The manufacture of modern jet aircraft requires a capital outlay which no company in Japan can undertake. So the bulk of the cockpit types must depend upon Japanese government to obtain assistance.

► Mitsubishi—The aircraft section of Mitsubishi has been actively involved work for the U.S. Air Force for several months, working on the B-25, C-47 and C-46. It is negotiating for F-86 jet engine overhaul and will have an assistance agreement covering this work with North American. Further plans for overhaul of the General Electric J47 are underway, according to Isao Nishigaki, aircraft section manager.

Recently Mitsubishi was contracted by the U.S. Civil Aeronautics Administration for the overhaul of Pratt & Whitney R2000 and R1830 engines. Another Mitsubishi contract is the assembly of Douglas S-52 helicopters for the Mustang Safety Board.

Mitsubishi had an advantage over most other Japanese aircraft manufacturers, as that its aircraft section was not split up by the occupation-imposed decentralization procedures.

► Kawasaki-Kawasaki Aircraft Co. was split into three organizations, and was reconstituted only at the beginning of last month. The firm, however, has made at least a modest attempt to re-emerge as Mitsubishi, and it goes step by step further along. It has designed and built its own four-engine biplane, the KAL-1, and is working on a trainer version which it hopes will be similar to the Beech T-34. It also makes a 240 hp. engine for this aircraft.

Under a lease with Bell Aircraft, Kawasaki will manufacture the 43-D helicopter. The firm was completely assembled from imported parts. After the 15th ship comes off the line, Kawasaki expects only engine and rotor will be imported.

The National Safety Corps (the operating or combat command under the National Safety Board) has ordered six helicopters. Orders are pending for the KAL-1 and the trainers.

A temporary agreement has been reached with Lockheed covering aircraft overhaul on the T-33, T-34 and F-94, some of which are now being put through the Kawasaki factory under the PLAP units. Included in the agreement is overhaul of the Allison J31 and J35 engines.

► Nakajima-Fuji—Another important manufacturer recently divided by the occupation, was Nakajima. The firm has recently been reorganized as Fuji Heavy Industries Co. It has a technical lease with Beech for the production of the F-14 Mustang. The first 50 will be imported knock-downs for assembly in Fuji's Utsunomiya plant. From the 51st unit, Fuji plans for complete production in Japan. One of the company's vice-presidents now is negotiating with General Motors for the engine manufacturing rights.

Besides the bomber, Fuji expects to receive orders for various versions of the North starjet, as well as other four-engine fighters.

Beyond that the company has no firm plans. The North American and Lockheed tie-ups with Mitsubishi and Kawasaki appear to have won up Japan's fighter requirements for some time to come. The country, with limited resources, probably must concentrate on a few basic aircraft for the military defense jobs. So Fuji is concentrating on guaranteed markets.

Handicapping Fuji is the long occupation of the pre-war and post-war facilities by the U.S. Army. Repeated requests for the return of the facilities, now called Camp Dux, have been rejected by the U.S. Army.

Former Nakajima made over 100 DC-3s and DC-4s. During the war it sent advance to the Boeing Aircraft Co., which continued to make transport aircraft for the Japanese military forces.

► Other Manufacturers—Shojo is doing no manufacturing at present, but it would like to make its connections with Douglas.

Shin Meiji Industry Co., successor to the former Kawasaki Aircraft Co., the last of the old Big Five, has been manufacturing military jet tanks for PLAP, has several other manufacturing firms. It has no other business, but is expected to have had some converse-

Retractable AIR INTAKE SCREENS Could make the difference

The safe interception of exasperatingly small bits of debris entering the engine intake could mean the difference between a safe return and no return.

Retractable Air-Intake Screens are a means of protection that allows the mission to be accomplished without the performance loss and icing feared of fixed screens.

Retractable AIR INTAKE SCREEN

Specifically designed and manufactured to meet flow compressor gas turbines... Hydraulic actuation system contained within the screen housing... Strict adherence to AHI standards and aircraft quality throughout.

or British engine makers.

West Germany

Aviation Marks Time Till EDC Ratification

By Gerald W. Schneider
(McGraw-Hill World News)

Bonn—Until the Western allies ratify
the Eastern Defense Community pact
or grant Bonn special permission of
some type, aviation in Germany will
remain stuck in limbo at a standstill. This
applies equally to civil aviation, aircraft
production and the projected German
air force.

'Lufthansa'

Officials of the proposed German
airline still hope to have their first
plane in the air sometime this spring.
It . . .

The big "if" in the way of realizing
plans for the new "Lufthansa" is the
indefinite delay in ratification of the
European defense community. Should
the EDC treaty not come into force
by spring as planned, Lufthansa officials
hope that the three Western powers—the
U. S., U. K. and France—can come to
an agreement which would let the
German fly their own airline even
though EDC has not been ratified.

► **Partial Delivery**—The problem of let-
ting the Germans fly their own planes
became increasingly acute in the last
month, since Lufthansa was scheduled
to receive the first of four quad-engine
Convair 580s by the end of February.
The German group had to turn the
plane down, and Union Carbide and
Carbide Corp. pulled it up. The Ger-
mans feel that the Allies should not
grant them the right to fly, without
waiting for EDC.

"Many of precedents now," Lufthansa
officials say. "You returned the
whole field of aviation safety to us, as
well as that of support administration.
If we can't import our planes now and

■ FOREIGN AIRPOWER

German trade plans for many years Luftwaffe officials hope to start their first European flights by July 1. Convoy 546 will fly from German cities to London, Paris and Zurich. A final decision on whether to fly to Madrid or Rome is still pending. Luftwaffe plans also call for up to six weekly flights to North America by summer 1975, with an estimated yearly passenger total of 38,000.

Luftwaffe's headquarters will remain in Cologne, while the fleet's home base will be in Hamburg where the city government recently appropriated DM 30 million for construction of necessary buildings and installations.

► **Training Program**—While waiting for the political green light, Luftwaffe is busy training its personnel. Five German pilots, all of them former Luftwaffe captains, went to England last December to undergo a 10-week training course at Air Training Service at Hemble. The youngest of these pilots is 41, the oldest 47 years of age. At the end of this course, the German pilots will receive British licenses.

Three German instructors are also attending this course as "observers." This group is made up of one technician, one meteorologist and one safety expert. At the same time, 21 Germans are now being trained in Cologne in engineering, radio operation and navigation.

Within the last year, the total Luftwaffe staff grew from 46 to a total of 280 individuals, and will probably grow to 350 within the next few months. It is obvious that, once the legislative obstacles have been removed, the Germans will be airborne within a matter of weeks.

German Air Force

Plans for the establishment of the new German air force are well advanced. Although most of the details are still secret (and the whole project depends on ratification of EDCG), the following are definite:

The new German force will consist of 20 groups: 10 fighter-bomber groups for technical ground support, five fighter groups, and five groups composed of transport, reconnaissance and rescue planes, including helicopters.

► **1,500 Planes**—The German air force, once completely established, will number about 1,500 planes. The Germans will also get a navy air arm, but this will be so small that they speak of it with embarrassment, if at all. It will include 24 long-distance reconnaissance planes and 10 helicopters for anti-submarine and rescue missions.

No decision has been made as yet on the types of planes to be used,

10 in the space of one

In the space currently used for shipping and storing one, we're taking Royal Jet steps into the future.

Royal Jet, Inc. designed, developed, and now manufactures the only ten to one high intensity ratio turbo compressor by the U.S. Air Force. These turbo compressors are currently being used on the latest and greatest jet aircraft. This means a powerful turbo compressor without the added weight, expense, and handling costs.

On one compact plane, 10,000 lbs. of thrust. And, when the 100,000 lbs. turbo compressor, which were used to assemble with simple hand tools. Whenever possible, Royal Jet continues to improve and enhance this operation—so that it's not just a dream.

■ FOREIGN AIRPOWER

where they will be obtained and whether they will be purchased by the Germans or be given them on a rent or EDC or NATO lend-lease arrangement. The Germans are anxious, of course, to get the very latest models. It is probable that at least the fighter planes will be U. S. models, but considerations are also being given to British and French types.

►Age Group Up—The German air force, including mechanics and other ground personnel, will number about 55,000 men.

Training these forces will be a major problem for Germany.

If the European Defense Community does not come into being within a year or two, few of the ex-Lufwaffe pilots will be young and healthy enough to form the backbone of the new air force. If EDC becomes a reality this spring, however, up to 50% of the pilots needed for the new Lufwaffe could be drawn from the ranks of World War II pilots, German sources say.

The scores of these pilots have been compiled in Bonn and the arm is now ready to start training at a moment's notice.

The other 50% of the future pilot force—recruits who are new to flying—would receive their basic training in Germany and other EDC countries.

The question of suitable airports will also become a problem for the new Lufwaffe. Some old German army fields, not now in use, may have to be enlarged and modernized. The Germans may also have to share some of the present airfields now assigned to NATO forces.

►Three Years to Build-It would be safe to expect the Germans are eager to bolster Western defense immediately after EDC is ratified. It will take at least 15 months after EDC ratification to get the first combat units going into the air, and it will take between 24 to three years before a new Lufwaffe is completed.

Bonn officials do not feel that the German aviation industry will be ready and able to contribute materially to the buildup of the German air force for at least two years after EDC is ratified. Even then, the German aviation industry will not be able to build military aircraft.

Planning for the new Lufwaffe is now in the hands of ex-Lufwaffe colonels Richard Blom and Werner Farnholz. Both men are experienced staff officers with considerable combat experience in World War II.

Aviation Industry

Nothing new can be reported from the German aviation industry. As the

These long-piloting operations on the helicopter are "bure" in the war against the enemy, spraying down the north with accurate precision.

"Operation Squirt" at East Coast Aviation

CHECKING RADIO EQUIPMENT. Two new Tech students follow the school's policy of "Learn by doing" as they check radio equipment in one of the planes.

FLIGHT PILOT. New Tech student enters after successful "first flight" in his Tech. Many graduates are now on line options and maintenance operations.

It involves an airplane. East Coast Aviation has probably done it. Located at Bedford (Boston) Airport in Massachusetts, this annual firm services regional and transient aircraft, operates the famous East Coast Aero Tech training school for pilots and mechanics, and participates in missions ranging from pest control to air-sea rescue. No doubt about it—East Coast planes get a workout!

That's one reason why, for the past eight years, East Coast Aviation has used Cities Service products exclusively. Says president John T. Griffin: "We have found Cities Service Aviation Gasolines and Koolinators Aero Oils capable of meeting the exacting requirements of our customers and our normal operations."

There's a Cities Service product to suit your aviation needs, too. Contact your nearest Cities Service office for information.

Could It Fly Without Cherry Rivets?

Certainly!

Without any doubt, the fastest piston-powered airlines—American Airlines and the DC-7 Flagship—could have been built (with some modification) without blind rivets. Cruising at 385 miles per hour in the quiet cockpit of the luxurious cabin, you, as one of the 40 passengers on the nation's first "average" business-class service, would never know the difference.

Yet, Douglas engineers will tell you that the thousands of Cherry Rivets used in the DC-7 make it possible to accomplish fastenings which otherwise would be difficult or impractical. For example, the sleek, aerodynamic design which contributes to the high speed of the DC-7 stems from the use of Cherry Rivets in fastening components of control surfaces and other streamlined sections.

This compact, unobtrusive rivet, the cabin interior, the wing or counter-rotating systems are designed to eliminate

noise buff and excess weight. They involve many blind spots which are inaccessible for conventional riveting. Cherry Rivets help make these conditions quickly, accurately—and costs are reduced.

Cherry Rivets are installed by one man from one side of the work by a special gun which feeds the rivet from the hollow shaft—opens the end on the blind side—firmly clutches the rivet in place—fills the hole—all in a single smooth, flicking movement. Cherry Rivets are but one group of the 10,000 types of fasteners and special cold-formed parts produced by Townsend in its varied plants. As "The Fastening Authority," Townsend will help you speed your production—produce better products—reduce cost by applying its method of resistance line to your fasteners and metal parts. Special facilities describing Cherry Rivet Rivets and other Townsend products and services are yours for the asking.

FOREIGN AIRPOWER

year ago by without EDC criticism, industry leaders felt that they are staying further and further behind the rest of the world in such matters as research, capable designs and a trained industrial force.

▲ **Aero Union**—Is a part of optimism, the "Aero Union" was formed last year by Douglas, Boeing, Focke-Wulf, Dornier, Heinkel and Messerschmitt. Aero Union had hoped to build planes in Germany, under license from U. S. firms, for the new Luftwaffe. The project, for obvious reasons, fell through and Aero Union has reverted to a state of organized inactivity.

In the meantime, the industry is turning increasingly to the production of other goods, decided to making automobile parts for Auto-Union and Tempo, Dornier is making buses, Focke-Wulf produces gliders, and Messerschmitt serving machines and three-wheeled "auto-rickshaws."

Gliding

Each year brings an increase in the popularity of gliding in Germany. Recently, West Germany's Aero Club reported a membership total of 45,000, of whom, about 12,000 are qualified glider pilots. Over 150,000 glider take-offs were made from 200 fields in 1935.

Top glider manufacturers in Germany are Focke-Wulf, Wulf Hirth, Altes Schleicher, F. W. Schmeidler, and the Fieseler Fi 156.

Most prominent promoter of gliding in Germany is Hans Hermann Reber, who took a lightplane off a Berlin street under Russian artillery fire during the siege of that city and was shot by the Germans to join Hitler in Berlin bunker before his death—Gerald W. Schneider.

Italy

Aviation Falls Short Of Earlier Promise

(McGraw-Hill World News)

Rome—Unsettled political and economic conditions both here and abroad have combined in another order hopes that 1935 would be a signal year in the rebirth of Italian aviation.

► **Birth-Led Plans**—The Rome Government had officially proclaimed its intention of placing at the disposal of the aviation forces 1,000 bi-plane planes, a plan had been prepared by civil aviation authorities that, at a cost of \$20 million over a three-year period, would have marked the first step towards placing the aviation services at a position matching the possibilities of the country.

The aerospace industry had required new energy. The few surviving factories were completing the first round production of the training planes that were to assure the revival of Italian aviation. At the same time, they were actively equipping themselves to meet the first NATO aviation procurement contracts, for producing and in receiving 2,500 parts in the south and 2,500 parts in the north.

The design of new training planes, and the preparation of new models for light transports and jet fighters were occupying the time of the best-known Italian engineers, concentrated in their work by the sword of government or else not by the hope of securing a share on the future plans for European rearmament.

► **Case At Aglers**—But this sudden revival of enterprise and of hopes could only give way in the year advanced.

The changed attitude was brought about by new political and economic conditions both at home and abroad characterized by the gradual loss, or at least postponement, of what had seemed to be the immediacy of the prospect of the revival of Italian aviation.

The political difficulties of June 7, when the Ciano government fell, produced a political situation differing widely from the previous one, and this has not failed to exert an influence on aviation plans.

In the first three years of the Italian aviation program, the newly mountable had been concentrated in low-level forces, with a view to promoting the formation of the largest possible number of efficient divisions for immediate use and to develop the line of flight of ground troops, now by the United States and Canada.

The strengthening of the air forces now to have started July 1, 1935, and part of the special organizations made for the army now have been transferred for this purpose. But the new government which took office after July 7, did not follow the special organization. So Italian aviation for the fiscal year 1935-36 had at its disposal only some \$140 million dollars—less than the funds allotted the previous year and 570 million below the minimum set which the Italian aeronautical officials had counted for starting the execution of their plans.

► **Partial Fulfillment**—It is not, therefore, surprising that under these conditions it has only been possible to give out partially the limited plan for 1935.

Of the 27 groups of first line aircraft which were to have been formed in 1935, only 19 have been completed, 12 of these supplied with jet planes—2,544 Thunderbolts and Vampires (in borrowed of the latter were built in Italy).

You Get Tight Grip—Safety and Economy with Townsend Tufflok® Nuts

The tight grip and great safety you get with the Townsend Tufflok® Nut come from its special design and materials which combine to make it the toughest nut-out ever produced.

Cold Formed Body of Tufflok Nut is in one piece. It has high mechanical strength and an exclusive patent design ensures positive seating of the nut.

Tough threads are cut in cold-forged steel—are stronger—again on inside—great gripping—speed up application—afford more safety.

Treated Hex Insert is rust-resistant, vibration-resistant, like having high mechanical strength. It resists moisture, drying out, high-octane gasoline and lubricants.

Positive Locking Action is provided by hex insert in which threads are impressed in three—setting up constant pressure against the bolt threads, providing a friction grip, and holding the nut tight against vibration.

Tufflok Nuts are economical—have been proved by use and by test. They are approved against Air Force-Navy Aeronautical specification AN-N-3 and are listed in Air Force-Navy Aeronautical bulletin ANA 1596 as an approved AN 364 Part under Nylk part numbers.

To learn more about the tight grip and positive resistance to vibration and shock obtained with Townsend Tufflok Nuts, write for literature.

* Licensed under the Nylk Corporation patents
Tufflok is a registered trademark of Townsend Company.

■ FOREIGN AIRPOWER

In the case of the infrastructure program only (S-1) has been carried out, though the part referring to the military aircraft program, financed by NATO, will be executed in full.

Italian officials under these circumstances of reduced financial means, the sudden advent of a considerable number of modern American jet planes has created further difficulties for the Italian industry.

The equipping of a squadron of modern American jet planes costs a good deal of money, and so the funds that had been intended to finance the program of new designs and construction in Italy have to a large extent been absorbed by the substitution of the aircraft received from abroad.

Italian authorities are now planning, within their meagre means, the objective of equipping the Italian air force to that in addition to producing and assembling the streamlined NATO models, it may also produce planes that have been studied with a view to meeting specific Italian needs (Italy is an island).

► **Experimental Production**—With this in view, priority has been given to the construction for experimental purposes of a small number of the following planes:

► **Sagittario**, an interceptor type airplane with sweptback wings and high climbing power. It was designed by Stefanutti, and is a first flying model, made of wood, was built by Ansaldo. A limited number is now being made at the Avio works in Naples. Italian experts think this airplane could be the means of defense in the poorer situation of Western Europe. They say its cost is only 15% of that of others of like character, British and American, though these latter have longer wings and armament.

► **G.82**, designed by Gabrielli. Fiat has started building a small series of this plane, and for training fighter pilots. It is fitted with a Fiat-Renault 1000 cc jet engine, and can attain a speed of Mach 0.9.

In addition, to these experimental planes, a number of de Havilland Vampire was built in 1951 to be used for training fighter pilots, and the de Havilland Vampire 145, the Macchi 416, and the Ambrosini Super 7, ordered in 1951 and 1952, were completed. They will be used for advanced training.

At the various experimental studies at Guidonia (Rome) three planes built to a basic trainer specification are now being built. They are the Fiat G-90, the Macchi M.B. 323 and the Fiat G-150. The future of these planes will depend on the impulse for intensive cooperation for Italian aircraft.

Among the more recent projects (which so far has not got beyond the stage of design) there is a three-engine jet design for medium-distance transport. Plans for this aircraft have been made independently by Zanussi of the Agusta Co., Marchetti of SAI Moschini, and Caviglioli of Piaggio.

► **Speed This**—The M-12 engine is in progress for subsonic passenger aircraft. Contracts have enabled Aeritalia of Naples to start active work producing under license F-84 engine parts. Fiat is doing the main part of work on the engines and fuselage of the F-86.

But even when no aid to these countries the orders placed by the Italian Ministry for Air Defense, the whole of the work has to be done too developed and too diversified to permit a civil and general organization of production. Present output is still far below the potential of the two thousand workers now in the employ of the Italian industries engaged in building planes and aircraft engines.

► **U.S. Aid Needed**—To assure the steady recovery of domestic production, qualified Italian authorities consider that a much greater effort would be required than they are now making, and they hope that further appropriations will be made for this purpose in the near future when the new government meets the defense estimates.

But however willing the government may be to do what is necessary, there are certain areas of defense that Italian resources will never be sufficient and that further American aid will be more than ever necessary, not only in the form of aircraft procurements, but in financial assistance for the purpose of supplementing Italian defense budget estimates.

At the last meeting of NATO, Italy undertook to make a further extraordinary appropriation of 250 billion lire (\$400 million) spread over two years for defense expenditure. Within the framework of the NATO program the Italian authorities also propose:

► To obtain from the U.S. an agreement that the F-106 (10 of which Fiat is assembling, but built outside Italy, as an alliance case. A group of factories in North Italy—Fiat, Piaggio and SAI Moschini—would be engaged, according to the size of the order, in building these planes.

► The same authorities believe that in view of the situation now existing between Fiat and General Electric, it should not be difficult to reach an agreement between the two groups under which the Sabot's engines also could be built in Italy.

Fiat might also make the G-82 trainer, should the trade with the Fiat model give good results.

The concerns controlled by IRI (the

Jet power FOR THE AIR AGE

These Continental gas turbines, now in production at C.A.E., are finding acceptance in a steadily widening range of applications where shaft turbines, or generators or turbo-jets are required. Manufacturers with present or prospective need for units of exceptional dependability are invited to bring their problems to C.A.E.

MODEL 110 AIR GENERATOR
Supplies up to 3000 kw. at 60 per cent, at 60 p.m. in production, for use as starter for large turbines, or as generator in other case as proposed.

JAC TURBO-JET
Jet power for largest and medium aircraft, and auxiliary power for transports and bombers. Develops up to 1,000 lbs. thrust and higher output as proposed.

CONTINENTAL AND OTHER ENGINEERS IN THE FIELD OF SMALL POWERED TURBINES. WRITE TO C.A.E., BRISTOL, ENGLAND AND TYPE OF WORK DESIRED.

CONTINENTAL AVIATION & ENGINEERING CORPORATION
1500 ALCOHOL AVE. CROFTON 15, MICHIGAN

FOREIGN AIRPOWER

Italian government) about all are to exist in the neighborhood of Naples, would build the *Sagittaria*. The technical regime for *Sagittaria* has not yet been selected. Aldo Romeo of Naples could build them while the others could be ordered from Northumbria, and the movement from *Sagittaria* and *Reda*. These plans might of course be considerably modified should NATO be set up, as the formation of such an organization might make it possible to follow more rational lines in the distribution of the work among the nations at the European Defense Community.

• **Cost control**—While the conditions of civil aviation in Italy are far from satisfactory, nevertheless the situation seems less unfavorable than it is the case with the aircraft factories. In improving the situation, a distinction should be drawn between the government's role, which have not been covered out because of insufficient up preparation, and those assigned to the companies, to whom the regular line services have been leased. These latter have been carried out to a degree that applies to assure favorable prospects of further development in 1954.

The general direction of civil aviation and air traffic has been stated

more than a year ago in a plan approved by the Ministry at Palermo which was sent to the Treasury with an application for a commitment of 5 billion lire for the first year and of 12 billion in each of the two following years (70%, or, ex-ante, 825 lire m. S.). The plan was blocked by the treasury and the department that made the request could not carry the money by which the funds could be provided, as required by Art. 41 of the Constitution. This means that nothing will be done until the problem was favor on the political plane.

When the plans which provided for the use of a two-engine transport to be built in Italy by Fiesco, Agusta or Macchi were blocked, lack of funds prevented also realization of a plan for purchase abroad of 27 new two-engine and two-engine planes, and cancelled the proposition of the construction of new airfields until to the needs of permanent carbon fuels at Venice, Palermo, and Genoa.

Work on the new intercontinental airport at Palermo was slowed down until the spring of 1954, because instead of the 24 billion lire estimated as necessary for the job, only 4 billion was appropriated.

• **Classed as the Black**—The only two Italian airline companies now operating LAL, financed by Italo-American capital, and Alitalia, financed by Anglo-Italian capital, are both back with satisfaction in 1953 and in the past years for the immediate future. Both companies closed 1953 with a profit, having flown over 30 million kilometers without recourse to any of the subsidies that in several days were granted to Italian air carrier.

With the assistance of credit, the airlines have been able to modernize and complete their fleets with up-to-date American aircraft. At present, the Italian transport fleet includes 10 four-engine planes (DC-6 and DC-48), already used for the transatlantic service or now expected to arrive, seven two-engine pressurized helicopters (Covair 240), and 140, and 20 DC-3, none of which has yet flown more than 8,000 hours.

• **New Flights**—The new aircraft now available will allow expansion of the Italian lines and more frequent flights on the most important routes.

It is expected that in the course of the year, flights to New York will be increased from two a week to a daily service, those for South America will have a three-day-a-week service, with stops at various points between Venezuela and Argentina. A line to Tokyo is contemplated, and the services with South Africa and Asia Minor will be extended. New stops will be added in Germany and Scandinavia—Dagmar, Stockholm.

DOW CORNING SILICONES

give motors more muscles

RELIANCE 20 hp (class H) Motor 330 Pounds Lighter than Conventional Design

For maximum safety, earlier planes are fueled and defueled immediately before take off or after landing. Several fast reversible pumps are used, any of which can fill or empty a plane's tanks within minutes. The pumps and their motors are big and heavy, however. So much so that the heavy challenged manufacturers to produce new motors which would combine top dependability and absolute minimum weight.

The Reliance Electric & Engineering Company attacked the problem both inside and out. They made the entire TDV frame and the mounting brackets of aluminum, ribbed for maximum heat dissipation. On the inside, silicone (Class H) insulation raises the power-ground ratio by over 50%, and also provides extra resistance to

weathering and salt spray. As a result, the finished motor is among the smallest and lightest ever made in this class. The 20 hp unit, for example, weighs some 330 pounds less than the conventional 20 hp motor. Already they have been specified for the new super carriers *Perseus* and *Savago*.

That's typical of the "design ability" of Class H insulation made with Dow Corning silicones. Adaptable to any electrical equipment and costing only slightly more than the next best class of insulation, it can be used to increase the power-per-pound ratio or to extend the life of electrical machinery over ten times. For better performance, lower maintenance costs, and greater sales appeal, start design and management men specify Class H insulation made with Dow Corning silicones.

U. S. Aid Starts Wheels Turning

(McGraw-Hill World News)

Madrid—The mutual aid pact between the U. S. and Spain has taken the lethargy out of Spanish aviation.

Four fields have been chosen as pilot U. S. Spanish air bases. Terceros near Madrid, Sanjurjo in Seville, El Copeiro in Sevilla, and Moron de la Frontera thirty miles out of Seville. Plans have been drawn to increase the length of existing runways on these fields and to strengthen them to accommodate aircraft such as the B-47. Two of the fields, El Copeiro and Moron de la Frontera, have no runways at present.

Direction-finder, ground-control-operated systems, and other navigational and ground equipment will be installed in anticipation of heavy traffic.

Aerial construction crews the aerial of the personnel from the American company of Raymond Concrete Pipe Co., Brown and Root, Inc. and Webb Construction Co., who are expected from day 90 days.

► Training Equipment—Training equipment and personnel have already arrived. Six jet mobile units have been set up at Talavera la Real in Badajoz to train pilots and crew members.

The units contain model T-33 engines, bomb-bay and radio equipment. Pilots will receive a short familiarization course here and then go on to North American T-66 and finally into the T-33 jet trainers.

The field at Badajoz has a newly constructed 7,500-ft. runway specifically designed for jet traffic. Thirty T-33 jets are expected before spring.

The number and type of American jets to be delivered to the Spanish air force is still undetermined. There is a natural ceiling on the numbers of jet fighters and bombers Spain can maintain," says American spokesmen. "This ceiling is dependent on the ability of the Spanish economy to support them. Spain will receive the amount of aircraft it can support," Spanish Air Force chiefs are studying the problem.

► Three Pilots Per Ship—The Spanish Air Force intends to show any aircraft they have and show them. Currently their fleet is composed of Spanish versions of German Messerschmitt 109 and Heinkel 111. The Contramarcas Antiaerianas and Regimiento Avionero factors will have outlandish orders for two hundred more Spanish versions.

Still doing it the Hard Way?

HERE'S AN EASIER, FASTER WAY...

Stretch Wrap Form . . . Set Joggles, Reverse Bands
and Severe Degree Changes — In One Operation.

There's no need for supplementary equipment, for the SHERIDAN Model E is a complete, automatic stretch wrap forming machine and balancer designed to eliminate many costly operations.

REAP THE BENEFITS OF FLEXIBILITY, LOWER COSTS

- 1 Adjustable Die Table—automatically moves for speed of die changes
- 2 Pay Roll—Bands—Controlled clamping pressure in split dies when forming parts with long lines, parts, sections, tubes, etc. Held down securely, not used to restrain roll due to speed control of the die table.
- 3 Independent Tension Cylinder—Automatic—handles forming of complex contours with one operation of a lever or cam.
- 4 Automatic Control—via motor the speed the highly skilled labor man sets a set up.
- 5 Easy to Operate—simple, foolproof, automatic work taught makes the Model E the most flexible machine of its kind
- 6 Trouble-free Operation—no high pressure flexible hose or other delicate parts to fail or wear out on schedule.

■ FOREIGN AIRPOWER

Messerschmitt and Heinkel. After these orders are filled, there will be no more. The total production of military craft has been less than 50 per year, and not all of these have engines. Many of the new engines produced are used to replace old ones in existing craft.

For every ship there are three pilots. The fleet was increased by 160 pilots last year, bringing the total to approximately 2,800.

► **Transport Growth**—While Spain's military aviation is still looking ahead, its commercial aviation has been going

ahead. Avianca y Comorra, the private line started in 1949, has been expanding constantly. Last year they put into service two Fiesch Langenloren and two Bristol 170s. More planes are on order.

During the past year the government supported airline firms, which themselves had the lowest accident rate, added three Bristol 170s and two Langenloren to its fleet of six Douglas DC-3s, 14 DC-4s, two Junker 52s and three de Havilland Doves. This spring they will receive three Lockheed Super Constellations. The Constellations will be used to expand transatlantic operations, possibly extending them to New York.

Beta now runs to Caracas, Buenos Aires, London, Paris, Frankfurt, Rome, Lisbon (three a day), Geneva, Tangier, Belo, Puerto Rico, Natal and Montevideo. The Beta and President lines were added last year. The company has applied for service to Colombia and Miami. Avianca y Comorra inaugurated three new routes in the past year—Bilbao to Bordeaux, Alicante to Genoa and Madrid to Rome.

Last year Beta operated with 40 crews. At the beginning of this year they had a total of 54 complete crews. The 15 crews at Avianca y Comorra also represent an increase over last year.

► **Industry**—The aircraft industry has been very active in development if not in production of commercial planes. Construcciones Aeronauticas (CASA) has designed and produced the Alcotán which can hold about 20 passengers and the Halcón which holds about 10.

These ships are totally Spanish, including original design and research. The prototypes are being tested while factories are retooling for production. The Alcotán and Halcón will be used for domestic airlines. —Joseph Bush

Aussie Aviation to Push Modernization

[McGraw-Hill World News]

Melbourne—There is no doubt that Australians are anxious to preserve their reputation as the world's most organized people and ambitious efforts are being made to proceed with modernization of Australian aviation, both civil and military.

It is generally believed that the efforts will be difficult.

RAAF

The Royal Australian Air Force has less than a dozen modern planes to serve its fast-dead flying and ground personnel. They are all forced to use a large number of long-range aircraft such as Wirraways, Beaufighters and Dakotas, plus obsolescent Lancasters, Mustangs and Vampires. The Australian industries and experts realize also that when orders for Canberra and Sabre are finally completed, these planes will be also obsolescent.

Planning is therefore aimed at the creation of a rather small but highly versatile force equipped with most modern gadgets in the field of modern and various armaments.

► **Too Good to Waste**—In every responsible Australian circles it is being agreed that in a future conflict, the

plant with a
one-track mind...

Actively Twin Coach Aircraft Division is five plants—each devoted exclusively to aircraft production. We do so other work, we build no other products.

Here's why this is important. It means your airplane assemblies are built by experienced aircraft specialists . . . men who know no other standards than those of the aircraft industry.

So if you have an assembly you're thinking of subcontracting, call us. Twin Coach Aircraft Division for consultation. You'll be secure in the knowledge that it's built by men who think like you . . . men whose one thought is to produce to specification and on schedule.

action field. The guns of the Australian Sabres are also larger than those of U. S. built Sabres (Aviation Week Feb. 8, p. 32).

So far the annual order for 72 Sabres has not been received and a decision on an eventual increase is unlikely in the near future. It all depends on the world situation at the end of 1954 and of the program made by CMC with the manufacturer of the fighters.

North American Aviation helped CAC with the project to a very considerable extent.

■ **Cadillac Cost**—The high cost of making the Canberra in government-

owned facilities in Australia is worrying the defense authorities and treasury officials alike. Latest estimates gave over £480,000 (\$900,000) as the current cost of locally produced Canberras at home, but independent, reliable observers quote the cost as being closer to £470,000 or more.

The question of the government-owned aircraft factories are subject to constant scrutiny and it is not known whether the high cost was due to a lagging efficiency or to cost of tooling-up and high Australian wages.

The fact remains that Australian-built Canberras were 60 to 80% more expensive than the same product as an English factory. This too, of course,

so involves comparison of the problem as to whether local aviation manufacturing industry should be encouraged.

■ **Need for Home Industry**—RAAF complained of the high cost of Canberras, but insisted that a local aviation building industry is desirable for emergency and as a source of spare parts and general maintenance. On the other hand, the industry was not too efficient and has had always to start work on a plane developed abroad at a time when the warplane aspects of that particular phase were already subject to drastic based on current research and achievement.

It is a question, the solution of which the Government will have to find in the near future.

Up to the time of writing, RAAF was living about six Canberras (including the imported ones). The experience was good, but the cost was skyrocketing RAAF leaders (for the first time led) by an Australian-educated Air Marshall.

Australia seems to be self-sufficient in fighters, with both CAC and de Havilland producing an acceptable job. Here again it is not expected that orders will be increased.

■ **Radars Abroad**—Modernization will be most pronounced in the field of pilotless planes. Orders for the unproved Radark are understood to amount to 34 units.

The new Radark Mk. 2 will have at least 50% greater power output than the Radark Mk. 1, of which only 12 were ordered.

There are many plans for the substitution of this small plane, but some experts believe that it will be an excellent expendable bomber with no atomic warhead.

Radark will certainly be used fully in conjunction with the newly developed British radars. The plane is expected to be a relatively cheap proposition, and many federal government officials believe that in the future the Government Aircraft Factories should entirely concentrate on producing this sort of equipment, perhaps even for export to United Kingdom on the understanding that the U. K. will supply Australia with larger modern air craft.

■ **Rocket Interception**—Out of the pilotless plane developments came a more radical phase on which initial experiments are being carried out. It is a delta-wing craft plane for interception of enemy-launched rockets. It is expected to climb at 50,000 feet a minute and reach a top speed of Mach 3. First and possibly will probably only a pilot (hatched on a dense rubber cushion so that pressure will be equally distributed over all his body). It may fly at heights up to 12 miles and will be

W FOREIGN AIRPOWER

launched from mobile interceptors.

When experiments are completed, the plane may be built in Australia, although the engines probably will be imported from the U. K. It is being tested at Woomera.

Naval Aviation

Naval aviation is developing slowly. Pacific and Sea Forces are the Navy's most modern aircraft but plans are advanced for the use of F4U Corsairs (fitted with Twin Mustang turbo-prop engines) for clearance reconnaissance work and for Sea Venetios for adversary aerial fighter support. This question is still not decided, but it is possible that de Havilland will build Sea Venetios in its Bankstown, Sydney, plant. Australian aircraft carriers will be fitted with angled flight decks and with steam catapults.

One aspect governing the Fleet Air Arm from obtaining its plans is the shortage of volunteers for training as pilots. Extensive plans are under way to attract more of the right sort of people to the force.

Export & Import

Australian aviation manufacturing circles are still pondering for more initiative in capturing neighboring markets for Australian planes. They agree that a price reduction of up to 35% will be possible if larger orders are placed.

But considerations against such proposals are numerous. From the political point of view, Australian authorities are critically apprehensive about using as Indonesian as other Air Force too close to Australia.

On the other hand, the British aviation industry is unwilling to lose markets and English influence prevents New Zealand from even entertaining the idea of buying in Australia while it is doubtful if the present capacity of Australian production is adequate to cater to exports as well as home needs.

►Second-Hand Hercules—In the mean time, Australia is a happy hunting ground for American and other buyers of second-hand aircraft. Certain airlines operators are slowly disposing of their obsolete planes, which are bought for conversion to executive planes in the States, or as meteorological planes (as was the case with a recent loss of Mosquitos).

Even greater problems are being faced in the field of imports. ANA's purchase of DC-4s instead of Victor Venetios provide better English criticism. So did Qantas' decision to buy Super Constellations. If Labor is returned to power in the mid-1960s

There must be a reason...

Since 1937, Librascope, Inc. of Glendale, California, has been offering courses of instruction to engineers. There are four major reasons why engineering personnel choose LIBRASCOPE. Foremost is the opportunity to participate in new and ever-changing problems. At Librascope you use your own experience and background and develop your career more quickly in the proper direction. Job security, good pay and full benefits are important reasons too, and, as the chart shows, greatest growth at Librascope has been since the war began, pointing to a sound industrial future for the Company in the rapidly changing computer and control instrumentation field.

Engineers—Physicists—Mechanicians for limited development and design of mechanical and/or electrical computers and for systems evaluation and analysis.

Electronic Engineers with following: computers, analog or digital, computers, servo, packaging.

3607 Glendale Street
Glendale, Cal.

general elections of 1954, it is certain that its policy will be to ban British rather than American planes.

Civil Transport

Principal Auster airline operators are preparing for a major reorganization in connection with their modernization of fleets.

Australian National Airways, which is still a leader, and particularly in the air cargo field, has purchased two second-hand DC-6s and has two DC-6Bs on order. The planes proved to be very popular in Australia domestic routes, and ANA's principal competitor, Trans-Australia Airlines, was also compelled to charter a KLM DC-6 to meet the opposition.

TAA is reporting its fleet of six Viscounts seems for use on domestic Australian flights. It is not yet known what ANA's next step will be in the modernization campaign, as the service, owned entirely by the British, is still fearful that a local transport failure may cause rejections of ANA.

Douglas Fan-ANA was always a consistent buyer of Douglas planes, and its technical staff likes the big U-5 planes, although considerable efforts are being

wade to persuade it to turn to Bristol Britannia. TAA, it intimated with Viscounts, may buy more of them or a later model of a similar plane.

Both airlines will probably have a problem with replacements for their DC-3s on feeder services.

Other Australian airline operators are also interested in a good cheap, safe and efficient replacement for DC-3s and for smaller planes. The only airline which tried the Hawker Siddeley Hermes in British Airline on other airline plans ready to follow the example.

Last year saw the "rationalization agreement" between ANA and TAA and services were realigned, with air-mail going due to ANA. Recent demands by airline pilots for higher wages and salaries may yet mean an increase in fares and rates and this may affect the traffic.

► **Business Pickup**—Following a slack business period in Australia, despite air fares have started to participate in a business recovery. Christmas 1953 saw records being broken by both ANA and TAA. In Australia's tremendously busy Christmas week, the two principal airlines carried over 40,000 passengers and ANA carried in a fortnight 10,000 million lb. of air cargo.

TAA's freight was 28% better than its previous best. In one week, Eastern Air's busy Christmas week handled 1,185 aircraft movements.

► **Intentional Mergers**—In the international airline field, the most important events were the prolonged negotiations for a merger of British airlines in the Pacific area. Several plans were formulated, accepted and rejected, and agreements were reported at least five times. The final agreement remains still to be decided.

Latest reports from usually very well-informed circles claimed that lack of agreement on some points of importance may yet stop the merger.

Qantas has continued development of its services, but BCPA has been looking somewhat anxiously at the steadily developing competition on its routes to North America. Prospects of acquiring Cathair in BCPA were viewed with limited enthusiasm by the airline's chief executives. Furthermore, the nature of good and relatively cheap British ocean liners to the Australia-North America route was making a definite shadow on future air operations on this route.

High hopes are, however, placed on the forthcoming start of "couch line" flights on this route.

Sound Motion Picture RESEARCH REPORTS

THE PROBLEM

Research Reports, prepared by prime or subcontractors, perform the vital function of analyzing product development, abilities and limitations in a broader sense. Research Reports properly conceived and effectively prepared, will acquaint members of the Armed Forces with current development of the equipment that will be ultimately played in their disposal. These Reports should not be confused with training aids, since their function is primarily one of education and not instruction. They also can be used to explain product and facilities to procurement officials and other interested parties.

THE SOLUTION TO THE PROBLEM

While experience in the production of commercial and educational film encourages one to question all of the current early, broad motion pictures in Chicago, Detroit and Hollywood as being completely necessary for the creation of quality sound motion pictures from the making of scripts to the development and printing of the film, White's writers are one of long and varied experience and in dramatic, commercial, technical aspects and language presented are the highest skilled in the film industry. As White, all of these facilities are in an organization under one management, where the very important element of continuity is extended at all times.

THE APPROACH

While many Research Reports have been prepared in the form of graphic materials, on ever increasing number of items are now being using sound motion pictures for this purpose. This is not because of any weakness in personnel, facilities or equipment, but because of the current inherent necessity of the modern-day motion picture as a means of mass communication. Motion pictures, implemented by dramatic scenes, appeal to both the eye and the ear, and command the audience's undivided attention. For this reason, the information they report is most deeply impressed on the mind of the viewer and remembered by him for a longer period.

STEEL PRODUCTS— the Source for Gears and Geared Units

Want production of a single gear? A complete geared unit? The Steel Products Engineering Company can do the complete job, under one roof. We have our own engineering staff for design, test and development work, in addition to tool design, manufacture and approved quality control. Our facilities include complete up to date machining equipment, plus plating, heat treating, and welding. If you want precision contract manufacturing in a "package" make Steel Products your source.

ENGINEERS AND MANUFACTURERS • SPRINGFIELD, OHIO

FOREIGN AIRPOWER

Research Laboratories and to expanding activities at the Witwaters estate in South Australia.

At the Witwaters range the British and the Australians were engaged in testing a new bomb for special use from high-speed high-altitude jet bombers. Strangely enough, a modified engine Leiston bomber was used for these tests. The bomber's main engine was standard Rolls-Royce Merlin, but its outer engines were Armstrong Siddeley Pythons, so that it is able to climb to altitudes about 40,000 feet in relatively hot time. A Canberra jet bomber has also been used.

Other interesting records at Witwaters are in the control investigation of high altitude clear-air turbulence, which is of great importance to jet operations.

The widest part played by the Australian Air Force in Korea has been the allocation of everyone to a considerable amount of desertion.

A transport unit is also operating in Japan, two fighter squadrons are gaining extensive overseas experience in India and a bomber unit, equipped with Leiston, is being retrained in Malaya. It is a good show for the relatively small population of Australia and a mark of their outstanding interest in aviation.—Maurice Gibbins

The Netherlands

Dutch Air Strength Ahead of Schedule

(McGraw Hill World News)

Amsterdam—The forecast for Dutch airpower this last year could read "bright and optimistic anyway."

Military aviation was so in ahead of schedule. Production was expediting. Commercial aviation beat the previous year's total.

Air Force

The expansion and modernization of the Royal Netherlands Air Force continued in 1953. In fact, expansion is ahead of planning. It is hoped that the first buildup of 21 fighter squadrons will be completed in 1954.

Fighter Strength—The delivery of 150 Gloster Meteor, 8 fighters by Fokker Royal Dutch Aircraft Patterns is nearly complete and will be fully completed early this year.

The Gloster Meteor of Air Defense Command will, however, gradually be transferred to industrial operations, and replaced as fighters by 156 Hawker Hunter F. 1 jet, construction of which now has been started by Fokker with Avondale and de Schelde.

Tactical Command has increased its Thunderbolt squadrons.

Basic and Training Flies for 1954 include a large scale expansion and modernization of a number of airfields. New fields will be put into operation, especially at Yperland near The Hague.

Further progress will be made with regard to bringing the operational squadrons up to war level. New methods of pilot training, based on American methods, have been introduced. The training time has been shortened, but the number of jet hours has been increased.

Although the Air Force has as yet no night fighters in its disposal, personnel is being trained for this special task.

Naval Air Service

The Naval Air Service has been reorganized in 1951. It consists of:
• Light fleet aircraft carrier Karel Doorman, with one fighter squadron (Hawker Sea Fury), one air reconnaissance squadron (Fokker Fokker and Gloster Avonquest). There are two reserve squadrons.

• Three amphibious squadrons (Fieseler, Grumman Avengers, Lockheed Hornets and Nightwings).
• Two fighter squadrons (Sea Panther).
• One squadron for reconnaissance services (Hawker, Fieseler, Hawker).
• One aircraft transport squadron (Hawker).

Beebe thrust stand for jet aircraft testing

Design engine thrust measurements, accurate within 1% of one per cent, can be made with this new piece of test equipment. Thrusts are obtainable for both single-engine and multi-engine planes and can be furnished for increasing up to 10,000 lbs. Thrust measurements are reduced in the maximum through the use of a direct action hydraulic system which permits exposure to turbulent flow and extreme temperature conditions.

In addition to the ground load stand pictured above, portable stands of equal accuracy can be furnished. Detailed information on both types is available. Inquiries are invited.

SMALL SIZE of new G-E subminiature metal-clad capacitors is particularly shown here. The one may now go as far left, approximately 110 times smaller size, than was the construction features of this new line.

G-E SUBMINIATURE METAL-CLAD CAPACITORS

With silicone end-seals and solid dielectric operate from -55°C to $+125^{\circ}\text{C}$ without derating

These G-E subminiature metal-clad capacitors are specifically designed to provide the utmost reliability under severe operating conditions. For over three years, Permafil (solid) dielectric has proved its reliability in aircraft engine control, airborne radio and radar communication equipment, ground radio communication and airborne fire control systems.

G-E subminiature metal-clad capacitors offer two important, unique features:

- **Solid dielectric**—G-E's Permafil—provides excellent electrical characteristics and eliminates the possibility of leakage.
- **Silicone end seals**—for high thermal and physical shock resistance exceeding MIL-C-33A requirements.

• **Multirated ratings** range from 600 to 1.0 μf in voltage ratings of 100, 200, 300, 400 and 600 volts d-c working. They can be operated at full voltage up to altitudes of 50,000 feet.

Case sizes range from .235 inches in diameter and 11/16 inches in length to 1 inch in diameter and .394 inches in length.

Unclad-filled metal-clad line also available with G-E Pyramil® dielectric for operation from -55°C to $+85^{\circ}\text{C}$ without derating. Lower cost, they incorporate all the operating advantages of the solid dielectric line and are supplied in the same ratings.

For more information see your G-E Appointed Sales Office, or write for bulletin GEC-987 to General Electric Co., Dept. 442-18, Schenectady 5, N. Y.

†Fig. 1 indicates of General Electric Co.

G-E SILICONE END SEAL

1. Solder right up to the case with new G-E silicone end seal—no need to worry big inch of valuable space because of danger of cracking glass.

2. Withstands vibration and rough handling. This view shows a glass-head-styled capacitor and a silicone-sealed capacitor being dropped.

3. Undamaged by dropping, the two capacitors are shown here. Note that there are no cracks in the G-E silicone-sealed unit.

4. At $+125^{\circ}\text{C}$ degrees centigrade, the capacitor consistently maintains 100 percent capacitance.

5. At -55°C degrees centigrade, the subminiature G-E metal-clad capacitor with Permafil dielectric shows less than 7 percent loss in capacitance.

6. Capacitance vs. temperature is shown by this typical curve. G-E capacitors with Permafil dielectric have very little capacitance change throughout the entire range from -55°C to $+125^{\circ}\text{C}$.

Bill is back...

...because someone made
his plane fly farther

He flew from bases in Japan. But his F-80 jet curved barely enough fuel to reach Korea and get back. He needed more time over his targets.

Quickly, the Air Force asked Fletcher Aviation what could be done. Answer: capacity of the unique Fletcher fuel tank could be increased from 165 to 255 gallons, in a hurry. Just remove sections from some tanks and add them to others.

From then on, Bill and his buddies flew their F-80s with fuel enough to triple the time over target—and get home with plenty to spare. Like a lot of others, we're glad he's back.

The framers of the Constitution sought to "promote the progress of science and useful arts." With this stimulus, creativity became an American hallmark and—in this incident alone—in the guiding principle at Fletcher Aviation Corporation.

■ FOREIGN AIRPOWER

petrol planes, Lockheed Martin and a number of Sikorsky helicopters).

A number of Lockheed Nightingales (with extensive petrol plant) have just been received from the U.S., as well as a number of Cessna 440s. A further supply is expected in 1954.

Production

Fokker of Schiphol, near Amsterdam, finished the main part of its Gloster Meteor Mk 5 order in 1953. The aircraft for Belgium and 136 for the Royal Netherlands Air Force will be completed early this year.

At the conclusion of the Meteor, 460 sweeping Hunter F. 1 jet fighters will be produced. Of these, 112 are destined for the NATO command under U.S. military supervision, 252 for Belgium and 156 for the Netherlands. Parts of these aircraft will be constructed by Aviodelta (of Papendrecht) of Schiedam (at Dordrecht). The company is to be constructed by Belgium.

► **Fokker Design**—The S-14 Meteor Mk 1 has been tested by many foreign nations. A series of this type is currently under construction for the Royal Netherlands Air Force, and another batch will be built for the Ben

al Government. The S-14 Mk 2 is now powered with the Rolls-Royce New engine, this type is currently being tested by Dutch and foreign services.

Fokker established a Benelux-Dutch Fokker company, Fokker Industriële Aankopen S. A., in Rio de Janeiro in 1953. This company will build under license an order of 100 S-11 fighters, 50 S-12 fighters, (some with variants), and 50 S-14 Meteor Mk 1, under-armor jet fighters for the Benelux government.

Production started in 1953 of 6 Sabre 3600 and 3601, the first of which will be delivered sometime this year.

Development work started in 1953 on the new Fokker F-27 Fourship two-engine 25-36 passenger aircraft, of which two prototypes are under construction.

Fokker's main 1954 production will be the Hawker Hunter series for NATO forces.

Fokker S-14 Meteor Mk 1 production will be continued and will probably be enlarged by new orders. F-27 construction will be in full swing.

► **The Leap**—This will be the Dutch production leap in 1954. Fokker's factories will have a capacity of 8,500,000 sq. ft. and employ 2,300 by May.

► **Aviodelta** has 500,000 sq. ft. and a 1,500-man work force.

► **De Schelde** has 51,000 sq. ft. and 500 personnel.

► **Avio-Diogen** of Ypenburg (near work) has 30,000 sq. ft. and some 300 personnel.

Civil Aviation

KLM Royal Dutch Airlines suffered a severe loss by the death of its founder and president (on the last day of 1953), Dr. Albert Heineken. No successor is contemplated at present.

Aside from that blow, the year has been a satisfactory one for Dutch aviation.

► **Traffic Results**—KLM's traffic totals for 1953 show a general improvement over 1952's figures. The following history compares the two years, with the 1953 results given first, followed by the 1952 figures, and the percentage improvement.

- **Distance flown** (km.), 45,500,000, 44,700,000, 9%.
- **Hours flown**: 147,000, 134,000, 9%.
- **Available ton-km.**: 247,700,000, 245,800,000, 14%.
- **Passenger**: 688,800, 577,000, 16%.
- **Mail**: 1,310,000, 1,130,000, 15%.
- **Freight** (kilos): 34,900,000, 14,350,000, +5%.

FOREIGN AIRPOWER

Super Constellation to arrive and four more are to be delivered in 1994. Two Douglas DC-6A 240-seat and 10 Cessna 441s which KLM will soon operate, as are to be allocated to the West Indies Division.

When all the aircraft are in order, an estimated 140 will be at the side of the Constellation and three Cessna 441s, KLM in 1994 will have a fleet of 91 aircraft, the majority being at the east up to date type.

The KLM network has a total route mileage of 171,899 miles. Several call centers are in 1993. It now serves 102 cities in 87 countries (34 cities in the Western Hemisphere).

► **Maintenance Data:** The number of charter flights was about 40% more than in 1992 (125 against 228). In addition, 86 cargo flights took place.

In 1993 KLM was first prize in the handling sector of the London New Zealand air race.

During the week following the final closure in Helsinki at the beginning of February 1993, KLM brought in 350 tons of steel supplies from over 30 different countries.

The number of personnel is now 17,545. This personnel totals 1,340, including 510 pilots—Paul Cote.

Sweden

Defense Strength Is Spread Thin

(McGraw-Hill World News)

Stockholm—In last year's defense budget, the Swedish Army got about all it asked. This year it got a swing back in favor of the Air Force. Of a total defense outlay of just over 2 billion kroner (about \$588 million at the rate of one krona = 19.1 cents), the Air Force now gets 34%, compared with only 30% last year. This means the Air Force's budget is 600 million kroner.

With the Army now getting 40% and the Navy 25%, the division of funds between the three is back at the 1992 level.

► **Seven-Year Program:** In the new budget the division for the Air Force will cover procurement programs in total from 2,085 to 3,150 million kroner (about \$600 million). This will enable it to meet the increased costs of new equipment, and make replacements at a reasonable rate.

The joint appropriation for aircraft purchases is increased by 180 million kroner to 450 million. Funds will be applied mainly to buying jet fighters from England to replace obso-

lout planes, and procuring a new fleet of transporters. The number of fighters will not suffice for replacing the Spitfires now used for reconnaissance with more modern aircraft, and over the long period there will be less rather than more fighters in service than there are now.

It may be noted that the most prominent item in Sweden's budget is not defense but social welfare expenditures. This situation will not be unaccounted, too, by the introduction of a costly system of compulsory sickness insurance.

Tanks are clearly too high for the maintenance of a really healthy economy—especially as they are relatively heavy (quite low down) on the income scale. Consequently 1 billion kroner for defense has come to be something of a magic figure in Swedish budgetary thinking. Seeing that no defense is not only growing in cost but also is relatively important, pressure to reduce the Army and Navy share of the defense total is obviously going to increase in the coming years.

► **Seattle Defense:** At present, Sweden's air defense consists mainly of day fighters. There is no anti-aircraft bomber force whatsoever, and not being a member of NATO, Sweden will not have tactical atomic weapons.

AUTOMATIC RIVETING!

CHOBERT High-Speed System

INCREASES PRODUCTION — CUTS COSTS!

FOR ALL BLIND OR OPEN RIVETING • NO SKILLED HELP REQUIRED • FULLY AUTOMATIC • UNIFORM RIVET RESULTS

The CHOBERT High-Speed Riveting System is especially designed for fully-automatic blind or open riveting. The pneumatic riveter can place rivets at a rate of 2000 per hour—solves blind rivet problems usually considered impossible with other riveting methods!

HERE'S HOW CHOBERT RIVETS WORKS:

- Insert rivet, automatically held steady by mandrel and jaws of ChoBERT pneumatic riveter, into proper hole.
- Press trigger of riveter. Mandrel draws back expelling rivet to uniform depth and tightness in set complete operation. Mandrel is automatically retracted by ChoBERT Riveter for use.
- Set! Sealed rivet is gas and watertight. Can be used without setting pin!

■ FOREIGN AIRPOWER

marade in chief of the Swedish Air Force, has stated finally that NATO will have to supply bombers if Sweden is to be defended. In essence, it should be added that Gen. Nissenfeldt has also put it so recent that personally he thinks Sweden ought to contribute to Western defense by joining NATO.

But even assuming NATO bomber support, Sweden's 10 day fighter and four tactical plane wings would have a task probably beyond their means—especially if the Russians advanced their fighter bases into Finland and on to the Baltic islands of Gotland and Bornholm.

► **Spread Thin**—Sweden controls about 1,000 miles from north to south, and there are important military concentrations, cities, industrial plants, cities, strategic depots, and power stations scattered all over the place.

Something of the dilemma involved was indicated by Gen. Nissenfeldt in an address in Gothenburg nearly two years ago. There he said fairly that instead of one day fighter wing which at last was, for adequate defense Gothenburg needs two day wings and one night fighter wing.

No such increase is on the cards, however, although Gothenburg is Sweden's most important port and the only one of any capacity for receiving supplies from the West. Outings from various quarters to open up an alternative supply route via the Norwegian port of Trondheim have met no response from the socialist government.

► **No Atom Missiles**—In the circumstances, Swedish defense thinkers are tending their attention more and more to the possibilities offered by guided missiles and atomic weapons. Swedish scientists could develop nuclear warheads, but the willingness of the West to share such these new weapons also keeps a good deal on Sweden's foreign policy line. And without Western aid, Sweden is known here as well as elsewhere as a country of squandering their resources on the sea. Sweden's experience with jet engines shows that.

Sweden tends to use out-of-control equipment, both of the conventional and guided-missile type. The radar warning system also needs extending. A lot of this is not one in the planning stage, but in any case it will cost a lot of money and will probably entail a considerable rearrangement of the overall defense setup.

The idea of atomic bombs, or at least the cost of them, does not seem popular in the Swedish circles that govern the country. Obviously, however, they would improve the chances of defense against invasion and could pro-

vide Sweden with a retaliatory weapon, especially as guided missiles.

► **J-29 and A-32**—In the meantime, Sweden's Air Force is going to have to get along with conventional equipment—and less of it, rather than more. Replacing day fighter wings with J-29s is still in process, and manufacture of engines for the Lansen A-32—with which the first tactical support wings are to be equipped—will not start until next 1955.

At the most about 200 of the all-weather A-32 appear to have been ordered. Such is declining some 600 J-29s, all told, but not all of these are being sent to the interceptor group. A number are being sold for ground support, and some for reconnaissance.

The J-29 is now approaching obsolescence, anyway, and so new Swedish fighter is in sight. Such is developing a new type from the highly little existing De Havilland, but no decision has yet been made as to what engine to power it with. To bridge the gap, the Swedes are looking to purchases of Hawker Hunters and Supermarine Swifts from England.

► **Production Expenses**—To build Lansen, which will become next J-29, Such is adding 10,000 square yards of factory space to the Lindöping plant. Together with some 2,000 sq. yd. of additional hangar space, the cost of this expansion will run to 40 million kronor (17.6 million).

One reason for the expansion is that the Lansen is a bigger plane than the J-29, and requires more space for production. But Such also has its eye on possible orders from abroad. Production facilities are also being expanded at the Flygvagns plant at Trollhattan where Richthofen's Aron 7 jet engine will be built for the Lansen. Plans to develop a new engine, automatically would that new wings will be produced—only that the Aron 7 engine may never see service. Previously Flygvagns has manufactured the Hawk engine for the Vampire fighters, and is now engaged in the production of Ghosts for the J-29.

Such's production of J-29s reached the scheduled rate in 1953. Company sales had then recovered remarkably, compared with 1946-48, and turnover was then 44 million kronor in 1945 to 152 million in 1953. Last year, too, the balance sheet showed an increase from 11 to 79 million kronor in the book value of the materials, manufacturing and work in progress. Compared with 1952, profits had risen from 1.9 to 7.3 million kronor.

Sweden's rather lively aircraft industry, is turning out to be good business.—G. Howard Smith

NEWS DIGEST

Domestic

Waffle's good record is held off side by North American Aviation's P-100 Super Sabre with a mark of 755.149 mph. Lockheed Aerospace International has relayed The F-100 to the record Oct. 20 in two runs: a 15-lap course at Silver Star Gold, during a speed battle with Douglas Aircraft's F-4D Skunk, holder of the 5-lap 753.4-mph mark. (AVIATION WEEK, Nov. 9, p. 34.)

Rapid Senate confirmation of Navy Secretary Robert B. Anderson's nomination as Deputy Secretary of Defense was expected last week. He will succeed Roger M. Kohn, who has resigned effective May 1.

RF-4F Thunderbolt, photo-reconnaissance version of Republic A-1H Thunderbolt, is in production at the aircraft plant at Fort Worth, Texas. The jet has aerodynamic ducts at the wing roots to permit more efficient installation. The first RF-4F was delivered to the USAF last week. The first delivery to the USAF is expected in the fall.

North American Aviation will begin work on the A-1H Thunderbolt in the fall. The first A-1H will be delivered to the USAF in the fall.

Boeing Aircraft Corp. has secured a \$100-million contract for 100 additional T-14A trainers, extending current production into August 1955. Boeing also is building T-14s for Japan and Chile.

North American Aviation's secretary treasurer Stanley Weiss, left last week for Vienna to continue negotiations with the Austrian government on financing of Austria's proposed national airline (AVIATION WEEK, Mar. 8, p. 32). The company is interested in supplying equipment and crew.

Assembly lines at Sperry Gyroscope Co.'s plant at Lake Success, N. Y., plant began turning out full production last week, freed by striking engineers who opened their picket lines in 14,000 union electrical workers. The Engineers Association called the walkout two weeks ago in a demand for a 1955 wage increase (AVIATION WEEK, Mar. 8, p. 7).

Frederic H. McElroy has resigned as CIA's chief of staff. He was replaced by John M. Meyer, former assistant to the director of the CIA. Meyer is now in charge of the CIA's operations in the United States.

New York Airways has cut its first quarter passenger fare between New York and Los Angeles and Newark Airport from \$15 to \$10.

Canada (Royal) Airlines, St. Louis, Mo., is a director of Northwest Orient Airlines and one of the first airlines to hold a job in U. S. and Canada, dated Mar. 8 at St. Paul.

E. G. Dawson, executive assistant to Sidney Auerbach's general sales manager, died Mar. 8 at Westport, Conn. He was 61.

Financial

Curtis-Wright Corp., Wood Ridge, N. J., reports net income of \$11,401, 791 for 1953 from sales totaling \$446.

\$15,482, compared with the preceding year's \$10,414 and \$10,181,645 in sales. Present backlog more than \$100 million.

Ryan Aeronautical Co., San Diego, had a net profit of \$195,695 during the first quarter of 1954, compared with the same as the first period last year. Sales and other income totaled \$11,849,917. Ryan's forecast for the year "continued high level of business."

Ellis Hahnemann's net income last year totaled \$247,017, a drop of \$199,127 from 1952. Sales and other income for the year totaled \$1,144,444 compared with \$1,144,444.

Boeing Aircraft Co.'s directors last week approved a 10-cent increase in capital stock, subject to approval of shareholders at its annual meeting Apr. 27.

International

Deutsche Messer 48 has exceeded the speed of sound in level flight at 25,000 ft., reports test pilot Günther von Fritsch. The French jet fighter is the first produced by NATO in Western Europe to reach Mach 3 with out the aid of a jet.

Canada has received a \$24 million order from the Canadian government for 100 additional T-14A trainers, ordered by the Canadian government. The aircraft will be produced by Boeing Aircraft Co. of Canada. The Canadian government has ordered 100 additional T-14A trainers, ordered by the Canadian government. The aircraft will be produced by Boeing Aircraft Co. of Canada.

First View of Douglas Skywarriors in Formation

Production model Douglas A1D two-seat Navy bomber-bomber has been operational A1D-1 is in formation flight over California's Mojave desert. The carrier-based A1D aircraft was used by the Skywarrior. Production Skywarrior are fitted with P-8V B-17 tailpans in the 10,000 lb thrust class design in post under the wing. Each of the three photos shows the in the above photo shows the aircraft in formation. Note the four engines mounted on outer Skywarrior. Douglas notes that the A1D has been designed to operate from Navy carriers previously in question as well as from the sea, larger French class now under construction.

Need high capacity, long service life, small size?

here's how leading manufacturers of pneumatic tools get them with **NEEDLE BEARINGS**

Torrington Needle Bearings are used in many leading brands of pneumatic tools because of their ability to take heavy loading, their compactness, and their long life.

In wrenches, nut runners, drills, rivet guns, impact and many other types of air-driven tools, the Needle Bearing's ability to absorb power output and torque, while saving weight and space, has been proved again and again.

On spindles, idler gears, planetary gears and angle attachments, Needle Bearings enable tool designers to keep tools compact and light. They

cost little more than plain bearings, yet they give high-capacity performance over long periods with minimum maintenance.

Throughout industry, Torrington Needle Bearings have become "standard equipment" since their introduction nearly twenty years ago. When space is limited and high capacity is a "must," specify Needle Bearings.

Why not learn whether the Needle Bearing can benefit your products. Our engineers will be glad to assist you.

Colonial Asks New Merger Bids

Eastern employees dump 100,000 shares of smaller firm; NAL, Mohawk try to block Rickenbacker move.

Presidential veto of the Eastern Colonial Airlines merger (AVIATION WEEK Mar. 8, p. 51) caused strong reactions throughout the industry last week.

Here are the developments:

- Colonial invited EAL and National Airlines to submit new bids.

- Eastern ordered its employees and directors to sell all Colonial stock, preventing Laurence S. Rickenbacker, holder of the largest single block of stock (5,500 shares), and others to sell unsatisfactorily the 100,000 Colonial shares concerned.

- National postponed Civil Aeronautics Board to proceed with hearings on a Colonial National merger and asked CAB to restrict Eastern from holding for Colonial until such hearings are completed.

- Mohawk Airlines asked CAB to restrict EAL from holding for Colonial until the National hearings are completed.

- Eastern in Colonial stock, was accused outside the airline industry.

- The Board ordered Eastern to show, come within 30 days why it should not be directed to terminate control of Colonial and why it should not be directed to cease and desist from acquiring control of the smaller airline or any of its assets or assets "without prior approval of the Board."

Capt. Eddie Rickenbacker, EAL board chairman, was known to be highly allied at the President's decision and

was reported even more determined to merge with Colonial at any cost.

Asst. Sec. of Defense—Maritime, Justice Department was reported to be on offshore action against Eastern for its previous control of Colonial, the latter that caused the President to veto the merger agreement.

Because EAL's controlling ownership of Colonial stock was "unlawful" under the terms of the Civil Aeronautics Act, the Justice Department could also CAB filed an injunction against the airline-merger action against Eastern.

Following Eastern's decision to divest itself of all Colonial shares Mar. 8, the Stock Exchange reported record selling of Colonial stock. The stock unsatisfactorily was affected, rising from 112 to 121 at the close of the day last Tuesday. It high has been 144 this year.

New York Colonial's board of directors was scheduled to meet in New York last week to open (asked both Colonial from Eastern and National. CAB was expected to act on the National and National petitions before the week end.

No indication was forthcoming from the Board as to how it might move in the matter, but in its order supporting the President's veto, CAB noted it would consider the National-Colonial merger hearings.

Mohawk forces continued holding of the Colonial merger case because it wants the dual bank, local service routes in the present Colonial system. Thus it

filed a petition at the same court National did last week, asking the Board to restrict Eastern from holding for Colonial until the hearings are completed.

House Passes CAA, CAB Budgets for '55

The House has approved fiscal 1955 budgets for Civil Aeronautics Administration and Civil Aeronautics Board without significant change in the Eisenhower Administration recommendations (AVIATION WEEK Jan. 25, p. 14).

The House took these actions:

- Passed a \$315,750,000 CAA budget.
- That is \$135,000 below the Administration recommendations. Of the cut, \$100,000 was for operations and maintenance of Alaskan airports. The \$350,000 allowed for that activity is \$40,000 more than the \$390,000 provided for the current fiscal year.
- The remaining \$35,000 was transferred from the appropriation for administrative expenses in the air navigation and development program, from \$100,000.

The House approved \$1 million, the amount requested, for Commerce Department participation in the research and development work of the Air Navigation Development Board.

- Approved \$40 million to CAB for airline subsidy payments. Added to an \$10-million carryover, this will permit payments at a rate of \$6 million a month until May 1, 1955. The Board's request of \$75 million for the entire year contemplated payments at this rate.

In House debate it was made clear that Rickenbacker's demand Mar. 1, will be considered, with new (AVIATION WEEK Mar. 8, p. 52). Two attempts by Rep. John Rostenko to reduce the figure to \$13 million failed first on a 361-to-391 roll call vote, and then on a 361-to-391 roll call vote.

- Approved the \$3,777,000 asked for CAB operations. This is \$27,000 more than the Board's current budget to provide for handling of airline subsidies, a task assigned last fall when subsidies were separated from airport pay.

The \$101 million provided for CAA is \$15 million below last year's \$116 million (AVIATION WEEK Mar. 1, p. 52). Economic Administration requests were in line, the House made no further reductions in these CAA estimates.

- Subsidies and expenses, \$96,458,000, compared with about \$105 million for the current fiscal year.

- Establishment of air navigation facilities, \$5 million, compared with \$7 million for fiscal 1954.
- Traffic and development, \$700,000, compared with \$750,000 for 1954.

Four design ideas you can use right now...

DEPENDABLE FUEL FEEDING. Fuel for the J45 Turbine Engine is shipped in the burner through Teflon® flexible metal hose. Tightly, light weight Teflon—lined for temperatures from -200° to +400°F and for pressure up to 800 psi—reliably transports fuel to engine sections without vibration and rough use is excellent for complex configurations.

FAULT-FREE INSTRUMENTATION. Designed primarily for instrument service at high altitudes, lightweight Teflon CF Connectors are pressure-tight and resistant to moisture and corrosion. They are made, tested, weigh only 1/2 lb. (or less)! Special sizes, meeting AIA Specifications, can be made with 2 in. 3 pin and all threads—and adapted to your design.

CUSTOM WIRING SYSTEMS. Teflon's properties in designing and building special "package" wiring systems and component assemblies for today's complex aviation and guided missile installations. These may be joined with protective sheath or other components—and Teflon Special Connectors used as integral parts solve complex wiring problems.

RADIO SHIELDING. Teflon's unique properties for radiating signals in our specialty Teflon makes a wide range of shielded signal lines, cables, mating rigid exterior specifications—on the radio component parts, such as waveguide leads for military and commercial aircraft. Teflon applications on V-4 engine 4-1120 engine include burner and heat.

FROM DESIGN TO FINISHED PRODUCT. Teflon is especially well qualified to help you with all problems of special metal hose, wiring and connections. Take advantage of the long experience of Teflon engineers in developing high temperature fuel lines, in designing and fabricating harness and wiring systems. Write us now about your application; our nearest representative will be glad to call and help you. Or send for our new 16-page Metal Hose Catalog No. 806.

GE Previews Baby Jet

First photo of General Electric's new XF39 gas turbine, designed for Navy B-7 bomber primarily as a turbojet powerplant, shows a mishap of the engine being tested by members of GE's research forward South American Engine Dept. Only company comment on the XF39's power is that it is "in the right range in power" in a family engine. Grouped by the turbine, left to right: L. T. Adams, manager of power, S. T. Collier, manager of manufacturing, J. F. Tuma, Jr., manager of marketing, J. S. Peters, general manager, D. Wall, manager of engineering, and W. T. Holman, XF39 project manager, who will direct design, development and application.

an operator was announced by the British Minister of Transport A. J. Lemmon-Bell, after consultation with the Air Registration Board, Air Safety Board and BOAC.

■ **No Public Inquiry**—Inquiries are that the disaster was partially due to the fact that the Concorde 1 crashed over the past 15 months. Cases have not been determined in the Efta crash, and to date there has been no public inquiry. Such an inquiry had been proposed by Lemmon-Bell.

British officials state, however, that no witnesses have been brought to light after several technical investigations of the Concorde.

More than 90 modifications have been or are being made, officials add, many designed to cope with theoretical aspects of the F100 aircraft and the BOAC crash near Colombia last May.

■ **NTSB Warns**—The decision to resume Concorde service indicates that all risks before nothing further a risk to come from current safety operations of F100s. It may take up to six months before the entire service of the aircraft will resume as recovered from the sea.

With the two unexplained crashes, BOAC may be lifting itself as for criticism by resuming Concorde service, some observers have said, but feeling seems to be that further delays will not assist the baffling crash-cause questions.

Coverage already has cost BOAC about \$1.5 million.

French carriers also plan resumption of Concorde service. Air France plans to put its three Concorde 1 back in the air next April, while Air France Aviation, the French airline (OAT) will start flying Paris-Buenos Aires this week.

Four Airlines Get Adjusted Mail Rates

Civil Aeronautics Board has adjusted the mail rates of four airlines: American, Capital Airlines, Delta and Eastern. The board has adjusted the rates of these airlines which are direct competitors with other airlines currently operating a mail 45-cent rate.

■ **Present Rates**—The board has adjusted the rates of these airlines which are direct competitors with other airlines currently operating a mail 45-cent rate. The board has adjusted the rates of these airlines which are direct competitors with other airlines currently operating a mail 45-cent rate.

■ **Board's Decision**—The board has adjusted the rates of these airlines which are direct competitors with other airlines currently operating a mail 45-cent rate.

rent, with provision that this temporary rate will be reviewed at a later date. It would be subject to restrictive adjustment, taking into account the effect of the 45-cent rate on competitive route segments.

Nonsked Proposes Scheduled Shuttle

An exception to an exception is what North American Airlines is proposing before Civil Aeronautics Board to institute shuttle service between New York and Washington.

The nonscheduled shuttle proposed by DC-4 between the two cities at a 510-minute fare, \$1.77 less than one-way service now provided by Eastern Air Lines and American Airlines. Tickets would be sold ahead of time, without reservation. Carriers baggage facilities would be provided.

■ **Schedule**—In order to approve such service, the Board would have to exempt the airlines from its present exemption regulations (regulations of the Civil Aeronautics Act permitting operation of nonscheduled service) so it could begin scheduled flights.

The idea for such service was brought last summer by a member of the Board in the belief that as airlines such as North American will probably want for this type service.

■ **148-hour Limit**—Last week the airline also filed a request for reconsideration of its earlier proposal (Aeronautics Week Mar. 1, p. 64) to increase the current maximum period currently under way by the Board.

The company also filed the proposal of two discounts to CAB's other airlines. The board has adjusted the rates of these airlines which are direct competitors with other airlines currently operating a mail 45-cent rate.

The company also filed the proposal of two discounts to CAB's other airlines. The board has adjusted the rates of these airlines which are direct competitors with other airlines currently operating a mail 45-cent rate.

ODM Sets Fast Tax Writeoff for New Labs

New research and development laboratories facilities are eligible for fast tax writeoff, says the Defense Manpower Office of Defense Mobilization.

The facilities must be used in development of products for which mobilization expenditures have been set. These include aircraft, missiles, tanks, ships, submarines, rockets, missiles, rockets, missiles, rockets.

ODM says the ruling "is designed to encourage further the important role of scientific and technical research in defense mobilization."

New NWA President To Face Internal Fight

The surprise of Harold R. Harris as president and chief executive of Northwest Orient Airlines must be the question of a likely successor who on a daily basis will be faced with the problem of resolving the serious internal problems in the company resulting from differences of opinion among both stockholders and management.

There are reported to be two strong groups of Northwest stockholders in New York and another in New Orleans, each having different ideas on how the airline should be run. Only recently resolved by these groups in recent months was agreement to replace Harris.

• **Bad Spot**—In order to get over a bad of progressive management program into operation, Harris' successor must first resolve these differences, gain the confidence of both the board and stockholders.

One observer summed up the situation thus: "Northwest is in a bad spot, and unless the new president is given a free hand, with little or no interference, there is no way of getting people having limited knowledge of airline operations, drastic reorganization will result."

Indications are that Malcolm MacLean may get the nod to replace Harris. This feeling is strengthened by the fact the board elected MacLean to the co-president, vice president post which he held prior to Harris' resignation of the company. Added indication is attached in the fact that MacLean made

the announcement of Harris' resignation, while board chairman Cecil Hunter had no comment.

• **Harris' View**—In reviewing his own career, Harris stated that "here and there" the definition of success has developed between itself and a group who possibly constitute a majority of the company's board of directors.

"These disagreements, involving the removal of policies previously approved by the board relate to basic policies underlying the planning for the company's future so that the company can smoothly discharge its obligations to the public, provide security and expand opportunities to its employees and offer a fair return to its owners."

Harris says his basic policies and programs received by the board in 1954.

• **Internal reorganization** of the company, to define and separate executive and administrative duties in order to free top management from administrative details. This involved moving of Northwest's executive offices to New York from New Orleans (November 2, 1955, p. 74).

• **Establishing credit and financial standing** to assure the company's survival. Harris pointed out that during the year he actually headed the company, net operating income was \$1,277,680 after payment of federal income taxes of \$1,591,000. This compares with a net operating income of \$543,000 in 1952 after payment of \$513,000 in taxes.

Net operating income available to common stock was \$1.01 per share in 1953 after payment of \$414,000 for preferred dividends, as compared with \$1

Short Bros. Produces Canberra Jet Bombers

Short Bros. produces tonight's bombers built by Short Bros., Belfast, Northern Ireland, and delivery to RAF Bomber Command. The super-jet Canberra bomber is being built by four different aircraft firms under subcontract. USAF version, the B-77A, is being built by Glenn L. Martin using Wright J65 engines.

cents per share after payment of \$4-10, 000 for preferred dividends in 1957.

• **Program for acquiring** long-range equipment for the future in order that Northwest might remain competitive. Reports indicate that the program will not follow through on its order for five Lockheed Super Constellation.

• **Planning for major** overhaul and improvements in services for the future welfare of the company and its survival as a major business.

• **Acquiring immediately** a small number of additional generalized four-engine aircraft.

• **Instituting** long-range economic and financial planning.

• **Establishing new maintenance facilities** at Twin Cities.

While Flavin, vice president for public relations and H. Don Reynolds, executive assistant to the president, accompanied him.

Reynolds' efforts had been appreciated by Flavin subsequent to his taking office in January 1957.

American Realigns Administrative Setup

American Airlines is reorganizing into four major administrative units under a new plan aimed at decentralizing its

throne in New York and increasing responsibility of officers in the field.

The plan calls for reorganizing into six administrative units, each headed by a senior vice president and assigning the duties of officials for better coordination.

Now, senior vice presidents in charge of the four units: C. R. Brown, sales; D. M. Mauer, operations; W. J. Hogan, finance and planning; and C. W. Jacob, service.

• **Simple Form**—American president C. R. Brown said the reorganization "shows up in the management of the New York management consultants—provides for a simple form of organization and one well adapted to the requirements of our business."

The departments are scheduled to be reorganized this month into the following structure:

• **Operations**—Reorganizing is setting up a new customer relations department in the east to handle passenger and cargo services under the direction of vice president R. S. Decker. "This will be a staff department which will establish the policy and standards in which American Airlines will provide services to its customers," Smith said.

Other departments under operations and the vice president in charge equipment development, M. G. Board, were

finance and engineering, Marvin Whitlock, purchasing and stores, G. J. Brundage, and flight, L. C. Felt (Aviation Weekly Mar. 11, p. 11).

• **Sales**—With the transfer of such functions as ticket and reservations of fare to customer service, the unit will be able to concentrate on production of additional revenue and increased sales through "lease" rather than less emphasis on a well-planned, hard-hitting sales program," Smith said.

Reporting to sales will be the public relations department under vice president Rex Smith.

• **Finance and Planning**—This unit has taken on the additional responsibility of operational planning, established the office of vice president L. E. Gilgore to handle all accounting and control and operated these duties from those of treasurer P. G. Lane.

• **Corporate Affairs**—Senior vice president Jacob has assumed duties as secretary and director of this unit, which includes the properties and community department under vice president Walter H. Johnson and the Washington office under vice president Carole Roberts.

Separate departments are accounts, under vice president William Littlewood, who will report directly to Smith, and personnel, directed by vice president G. W. Griffin.

FROM ^{THE} Verson ^{NAME} A COMPLETE RANGE OF HYDRAULIC PRESSES

1200 ton straight side

750 ton post type

400 ton double effect

400 ton slugging press

300 ton box press

100 ton bending press

Write for your copy of the new Verson Hydraulic Press Catalogue which contains detailed data on the entire Verson hydraulic line.

In the Verson line of hydraulic presses, there is a size and type to meet virtually every need from 75 tons up. In addition to the more common types illustrated above, Verson also manufactures such special models as gap type presses, ballroom, hobbing presses, rubber pad casting presses and pipe forming presses. If there is a question as to whether a mechanical type or a hydraulic type is best for your job, Verson, as a leading manufacturer of both types, is able to make unbiased recommendations.

Whenever your press problem, bring it to Verson and take advantage of our extensive know-how and experience.

A Verson Press for every job from 50 tons up.

BOURNS sub-miniature TRIMPOTS

PROVIDE
THE ULTIMATE
IN PRECISION
TRIMMING

Simple non-wirewound adjustment...

The TRIMPOT is a 250K linear, fully adjustable non-wirewound potentiometer, designed and manufactured exclusively by Bourns Laboratories. Electrical ratings in accordance with MIL-STD-202 are maintained during vibration of 20 G up to 2,000 cps or sustained overcurrent of 100% for 100 hours. Bourns' unique self-healing design eliminates catastrophic failures. Power rating is 1/4 watt at 100°F. Standard resistance values from 250 ohms to 250,000 ohms are available for immediate delivery. Information on higher load power resistors can be requested.

Precision TRIMPOTS are recognized as standard components by aircraft and missile manufacturers (see list) and are also suitable for computers.

5 TRIMPOTS
TAKE LESS
SPACE THAN
A 25 STAMP

Five standard sizes—only 1/16" x 3/16" (or 1/8" x 1/4")—and many other sizes are available. These TRIMPOTS are easy to install in standard assemblies with two standard sizes through the body option.

Bourns also manufactures precision potentiometers in standard Linear, Rotary, Slide, and Potentiometer, and other standard forms and functions.

Laminated • compressed Hy-du-lignum... at work! made-to-measure density

Here you see Hy-du-lignums in two of its many uses. The marform blocks or dens made of Hy-du-lignum are used on marform presses at North American Aviation to form parts out of aluminum alloy sheet stock.

For the spacing block (diamond), the material proved so easy to work that the tool was made by a spin lathe operator at North American Aviation's Columbus, Ohio, Division plant, famous of a toolmaker.

Whatever your sheet metal tooling needs may be, for sheet or long run production, Hy-du-lignums is the die stock material you should use. It meets all requirements for large or small diameter.

There are many uses for Hy-du-lignum

- Helicopter Blades
- Drill Jigs
- Locomotive Boilers
- Rubber Press Blocks
- Clamping Fixtures
- Tube Bending
- Templates
- Stretch Form Tools
- Contour Rules
- Spinning Blocks
- Shop Aids
- Form Rolls
- Head Form Blocks
- Drill and Router Blocks
- Die and Router Blocks
- Spin Assembly, Spot Weld Fixtures, etc.

Form dies for hand lay up or rubber bag molding mechanical (alloy) patterns.
Standard size blocks 24" x 32" are available:
in thickness up to 2" in both High and Medium Density;
24" x 32" over 2" up to 4" thick in High Density;
24" x 32" x 14" over 4" is thickest in High Density.
Blocks of non-standard size may be had in any Density up to 8" in High Density, and up to 4" in Medium Density.

The
Pioneer 
guide surface
personnel parachute
descends with

**minimum
oscillation!**

The Pioneer P7-B, P9-B Guide Surface Personnel Parachute is recognized by the aviation industry throughout the world as a great advancement in parachute design and is now definitely proven as the most efficient life-saving parachute used by jet plane pilots.

Less opening shock . . . Less oscillation . . . Less side drift . . . Jumper descends virtually straight down landing on his feet.

PARACHUTES MAKE THE DIFFERENCE

^aPhases applied for to U.S. and selected countries throughout the world.

Flying Lab makes 500 Landing Approaches in "Pea Soup"

THE STORY BEHIND THE STORY

WE TALKED WITH A PASSENGER IN A plane "marked" above a fogged-in airport—as if you've been the pilot at the controls—who was seriously interested in how-often like this shows up in airports in a few months ago.

Below these headlines is the dramatic story of man flying when "iron" has no wings, making landing approaches over and over again, to make your future landings safer in bad weather.

Working with the Air Navigation Development Board and the U.S. Weather Bureau, Sperry flight research personnel have completed 500 bad-weather landing approaches in a Sperry laboratory equipped with specialized instruments. In flight, both manual and automatic recordings are made of conditions encountered during the final 500 feet of descent.

On the ground, trained observers report what they see, and measure sailing instruments which measure sailing and visibility conditions existing in the runway approach zone. Synthesized

and analyzed, these records reveal the quality of the instrument and establish a wealth of information so pilots will know what weather to expect along the line of descent.

Because of its many years of experience in low-visibility approaches, Sperry was selected by the government to make the weather measurement study. This project is typical of the exacting flight research which is conducted at Sperry—flight research not only to perfect Sperry instruments and controls, but to advance the operational efficiency of both commercial and military aircraft.

SPERRY
HYDROSCOPE COMPANY

What size is a quality fastener?

Here are two ELASTIC STOP® nuts.

Each has the familiar red locking collar. Each is self-locking, vibration-proof and can be reused many times. Each is a fast, readily assembled one-piece unit . . . will maintain accurate adjustment anywhere on a bolt. Each will afford positive protection against thread corrosion . . . prevent liquid seepage along bolts. Each is manufactured in quantity. Each is exactly controlled as to quality of raw material, finished dimensions, class of thread fit, seat squareness and finish. Each has a record for precision and uniformly high performance that is unmatched.

But . . . one measures 1/10 inch across the flats; the other, 4 inches. Between these two, there are more than 530 different hex nuts in the ESNA line. They are the result of variations in height, material, finish and size.

Look to ESNA for the top quality self-locking fastener that fits your need best.
